LUDOVICI II  
REGIS

TO SIR HENRY BARKLY, K.C.B.,

CHAIRMAN OF THE BOARD OF VISITORS TO THE MAGNETICAL, NAUTICAL, AND  
METEOROLOGICAL OBSERVATORY, GOVERNOR GENERAL  
OF THE COLONY OF VICTORIA, &c.

SIR,

I have the honor to transmit to Your Excellency the accompanying  
Report and Tables, containing a Summary of the Results of Observations  
made during the Year 1858-59 in the various Observatories under my  
direction.

I have the honor to be,  
Your Excellency's most obedient Servant,

GEORGE NEUMAYER.

FLAGSTAFF OBSERVATORY,

*June, 1860.*

# PREFACE

It is a matter of common knowledge that the importance of observations calculated to advance the science of astronomy has long been appreciated in this Colony. It was the enlightened liberality of His Majesty King William IV. of Prussia who, in 1840, by a royal decree, authorized the Government of Prussia to send a powerful expedition to the Australian Continent during the years 1842 and 1843, to render assistance to the Astronomical Observations which would be required to make the necessary preparations for the establishment of an Observatory in Melbourne.

On my arrival in Europe I was fortunate enough to meet everywhere with sympathies for my plans, and it was the enlightened liberality of His Majesty King William IV. of Prussia who, in 1840, by a royal decree, authorized the Government of Prussia to send a powerful expedition to the Australian Continent during the years 1842 and 1843, to render assistance to the Astronomical Observations which would be required to make the necessary preparations for the establishment of an Observatory in Melbourne.

The manner in which I was received almost universally on my arrival in this Colony, the warm support I obtained from the Chamber of Commerce of Melbourne and the Press, the cordials and the conviction which I had formed at the time of my previous visit, that science would be fostered, and a favorable ground whereupon to grow, and to be cultivated, all these things, and the opportunity to express my gratitude for all the sympathy shown to me personally, and to the cause of the science I have made the study of my life. When speaking of the progress of the working of the Observatory, the duty devolves upon me, thankfully to the many friends of the handsome and energetic manner in which my countrymen, the Germans, have been forward in support of my views, raising by subscription a sum of £500 towards the erection and organization of the Observatory.

It is a matter of common knowledge that the importance of observations calculated to advance the science of astronomy has long been appreciated in this Colony. It was the enlightened liberality of His Majesty King William IV. of Prussia who, in 1840, by a royal decree, authorized the Government of Prussia to send a powerful expedition to the Australian Continent during the years 1842 and 1843, to render assistance to the Astronomical Observations which would be required to make the necessary preparations for the establishment of an Observatory in Melbourne.

It is a matter of common knowledge that the importance of observations calculated to advance the science of astronomy has long been appreciated in this Colony. It was the enlightened liberality of His Majesty King William IV. of Prussia who, in 1840, by a royal decree, authorized the Government of Prussia to send a powerful expedition to the Australian Continent during the years 1842 and 1843, to render assistance to the Astronomical Observations which would be required to make the necessary preparations for the establishment of an Observatory in Melbourne.

## PREFACE.

---

DEEPLY impressed with the importance of observations calculated to advance the science of Terrestrial Magnetism, and convinced that the rapid and enlightened progress of the Colony of Victoria would ensure for physical science a powerful support in the Southern hemisphere, I resolved, on my visit to the Australian Continent during the years 1852 and 1853, to return, after remaining in Europe only so long as would be required to make the necessary preparations for the task of establishing an Observatory in Melbourne.

On my arrival in Europe I was fortunate enough to meet everywhere with sympathies for my plans; and it was the enlightened liberality of His Majesty King Maximilian II. of Bavaria which secured to the undertaking a speedy execution. Provided with a most excellent collection of magnetical, nautical, and meteorological instruments, I left Europe, after having received a most cordial and valuable support from the Senate and the *Commercium* of the free City of Hamburg, and landed in this Colony on the 27th of January, 1857.

The kind manner in which I was received almost universally on my arrival in this Colony, the warm support I obtained from the Chamber of Commerce of Melbourne and the Press, confirmed me in the conviction which I had formed at the time of my previous visit, that science would find on these shores a home and a favorable ground whereupon to grow and to be cultivated; and I take this opportunity to express my gratitude for all the sympathy shown to me personally, and to the cause of the science I have made the study of my life. When speaking of the time prior to the working of the Observatory, the duty devolves upon me thankfully to make mention of the handsome and energetic manner in which my countrymen, the Germans resident in this Colony, came forward in support of my views, raising by subscription amongst themselves the sum of £500 towards the erection and organization of this Observatory.

Although my proposals for the erection of an Observatory for the advancement of physical science had been made to the Government of this Colony on the 15th of June, 1857, it was not until the end of that year that funds were granted by the Legislature and steps taken to proceed with the organization of the institution.

The selection of a site was a matter of considerable difficulty, and as particular attention was to be paid to the demands of the science of terrestrial magnetism, I devoted the whole of the months of September, October, and November, 1857, to investigations calculated to throw light upon the relations of the various localities around Melbourne as regarded their fitness for observations on the magnetic elements. The results of these observations made it incumbent upon me to recommend to the Government that a piece of land on the southern side of the River Yarra, on the hill near the reserve of the Botanical Garden, should be granted for the Observatory, that being the only spot which I found, in every respect, suitable for the purpose.

It was not, however, deemed advisable, at that time, to grant the site proposed, and thus it happened that temporary arrangements were made on the Flagstaff Hill, using the buildings of the late Signal Station for offices and quarters.

Systematical observations could not be commenced until the 1st of March, 1858, and then only in the meteorological branch and in navigation. The observations on terrestrial magnetism began with the 1st of May in the same year, and notwithstanding the small sum granted for the Observatory during the year 1858, the plan of working, as described in the following pages, was adopted and carried through in its integrity, and I would humbly add that this could not have been effected without considerable self-denial on the part of the staff, consisting only of myself and two assistants, whose names I feel great pleasure in mentioning, namely, Messrs. J. Bauer and J. W. Osborne. At the commencement of the year 1859 the position of the Observatory was considerably improved, the Legislature having granted a sum of money more adequate to the requirements of the institution; and on the 1st of March, 1859, the anniversary of its opening, its efficiency was again increased by the meteorological stations in the country having been placed under my direction.

At the conclusion of the first year's observations, it became my earnest desire to give a report on the labors of the Observatory, but this was a task of a peculiarly difficult nature, in consequence of the whole of the registrations having been obtained in French measure. As I did not think myself justified in bringing before an English public results of observations in foreign measure, and as it was impossible, with the staff at my command, to reduce the whole bulk of observations into the English standard, I resolved, with the approval of the Honorable J. O'Shanassy, then Chief Secretary, to publish an extract of the observations made, and to withhold the publication of the original observations for a future occasion.

The leading principles according to which this task has been carried out are as follows :—

1. To give the principal features of the meteorology of this Colony—firstly, in daily means, deduced from hourly observations on the various meteorological elements made at the Flagstaff Observatory; secondly, in five days' means; and thirdly, in monthly summaries.
2. To give at considerable length the diurnal variations in the different meteorological elements, as well as to exhibit the influence of the direction of the wind upon the various meteorological instruments.
3. To give a complete copy of the following registrations—namely, the simultaneous observations with the hygrometers of August and Döbereiner-Regnault; the halos throughout the year; the zodiacal light and meteors; the upper currents of the air; all cases where the atmospheric electricity was negative; and a complete registration of magnetic storms and Aurora Australis.
4. To supply a nautical report containing some of the most interesting results of the labors of the Observatory in this direction, refraining, for the present, however, from giving copies of the registrations kept, according to Maury's principles, the time of registration being too short to give them that value which a greater series will ultimately possess.
5. To furnish a short report on the observations made on terrestrial magnetism.

In reference to the latter branch of this report I take this opportunity to state that I could have added a large number of observations, forming parts of the Magnetic Survey of the Colony, if I had not considered it better to publish the whole in one volume as soon as the observations shall be completed. Publication in fragments would be calculated to impair the value of the work.

The fact that the reduction of the observations into English measure and the arrangement of the results from the journals of the country stations could not possibly be completed before August, 1859, as my attention then was directed towards the organization of a uniform system of meteorological observations throughout the country, according to the system adhered to in the Flagstaff Observatory, retarded the publication of this report very much. To this cause of delay was added my frequent absence from town on behalf of the Magnetic Survey; and the manuscript could, for all these reasons, not be placed in the hands of the Government Printer before the month of November, 1859.

It is evident that this present report falls far short of doing full justice to the extensive labors of the Observatory. To this end the observations ought to have been published in full, which, however, could not have been done for the reasons above enumerated, and so I hand over to the people of this Colony, and to the scientific world at large, these short outlines of the objects I have endeavored to accomplish, feeling satisfied with having thereby given evidence as to the usefulness of the institution both for practical knowledge and theoretical speculation.

Great as is the field of research great also should be our exertions to gain an approach towards the truth; and in order never to slacken in our zeal, we should bear in mind what the great philosopher said, whose death we recently lamented, and I may be permitted to conclude these few remarks with a quotation from the second volume of his *Cosmos* :—

“Weak minds complacently believe that in their own age humanity has reached the culminating point of intellectual progress; forgetting that by the internal connection existing among all natural phenomena, in proportion as we advance the field to be traversed acquires additional extension, and that it is bounded by an horizon which incessantly recedes before the eyes of the enquirer.”

GEORGE NEUMAYER.

EXPLANATION OF DIAGRAMS.

WITH the view of facilitating the deduction of satisfactory conclusions from the following Tables and Diagrams, it appears desirable to state a few facts in reference to the geographical position of the Flagstaff Observatory.

From several sets of observations, made on various occasions, the position of the Observatory was found to be in  
Latitude 37° 48' 45" south;  
Longitude 9h 39m. 53s. east of Greenwich.

The hill on which it is erected is situated on the N.W. side of Melbourne, the chief portion of the city bearing between N.E. and E.S.E.; there are, however, buildings in every direction, especially in the N.N.W. and S. Notwithstanding the slight elevation of the hill, (the cistern of the barometer being only 120·7 feet above the level of the sea,) it commands a distant view all around the horizon, being only bounded by the sea in one direction, and in others by mountain chains at an average distance of twenty miles. The large sheet of water forming Port Phillip and Hobson's Bay is situated between the points S.W. by W. and S.S.E., whilst that triangular-shaped portion of Bass's Straits between its extremities, Wilson's Promontory, and Cape Otway, bears S.W. ½ W. and S.E. ½ S. A line drawn N.W. by W. will touch the northernmost point of the great Australian Bight, coinciding at the same time with the dividing range of this Colony, from Ballaarat to where it bends at right angles to its former direction. The country to the south of this line is generally low and level. The axis of the dividing range to the east of Port Phillip; running E.N.E., passes nearly through Melbourne; so that the bearings of the most elevated points, which are frequently covered with snow, is E.N.E. ½ N. Between these two lines, N. 60° W. and N. 60° E., the coast ranges extend; and beyond them, in the same direction, are the valleys and plains of the Murray. A spur of the dividing ranges, terminating in Wilson's Promontory, causes the country lying immediately to the east of Melbourne to be rather hilly and uneven.

The above remarks will prove of considerable interest to any one perusing the tables given in the paragraph which treats on the Windroses, and on the influence which the direction of the wind exerts on the various meteorological elements.

Before proceeding with the description of the single Diagrams it is necessary to state here that, after the printing of the tables forming this Report, it was found, that in reducing the rain-fall for *Melbourne* from French into English measure, a slight error had occurred. For this reason, all amounts of *rain for Melbourne* (Monthly Abstracts, from April, 1858, to February, 1859; and Table, section 74; Summary X.; Five-day Means for the same period; and also Monthly Summaries, including Comparative Tables,) are to be multiplied by 1·108, (Log. 1·108 = 0·04454).

According to this, the following corrected Rain Table for Melbourne was computed, containing the amounts for the five-day periods from the 1st April, 1858, to the 1st March, 1859, as well as for the single months, from April, 1858, to February, 1859:—

| DATE.     |     |     | PERIODS.                   |                             |                              |                              |                              |                              |                      | SUMS.        |

The total amount of rain for the period over which this report extends is 23·914 inches. In arriving at this result, due regard was given to the fact that the above remarks do not apply to the amount for March, 1858. The amounts of rain, as given in this paragraph, need no further reduction.

TABLES I. to XII.—Contain the curves of the daily means in temperature of air, pressure of air, relative humidity, positive atmospheric electricity, force of wind, amount of cloud, and the fall of rain; and in addition to these the curves of the extremes in temperature of air and pressure of air, and the mean direction of the wind attached to the barometric curve, the direction being understood “*with the arrows.*” Barometer, thermometer, and hygrometer curves contain, in each case, the mean of the respective month and the mean of the whole year; the former is indicated by a plain, and the latter by a dotted line. In atmospheric electricity, the mean of the month only could be shown, as the observations of this meteorological element extend only over a period of  $10\frac{1}{2}$  months.

TABLE I.—*Month of March, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $7^{\circ}01$  above,  $0.065$  inch above, and  $0.059$  ( $0-1$ ) below the respective means of the year.

TABLE II.—*Month of April, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $0^{\circ}88$  above  $0.153$  inch above, and  $0.016$  ( $0-1$ ) below the respective means for the year.

TABLE III.—*Month of May, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $3^{\circ}63$  below,  $0.050$  inch above, and  $0.085$  ( $0-1$ ) above the respective means for the year. Very interesting is, in this case, the barometrical curve, which shows a remarkable depression between the 6th and the 18th, due to a succession of heavy northerly gales.

TABLE IV.—*Month of June, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $9^{\circ}89$  below,  $0.160$  inch above,  $0.122$  ( $0-1$ ) above the respective means for the year. In uniformity with the monthly abstracts for June, this diagram contains one period of five days more than usual.

TABLE V.—*Month of July, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $9^{\circ}95$  below,  $0.047$  inch above,  $0.116$  ( $0-1$ ) above the respective means for the year. There was a heavy fall of rain on the 12th, viz.,  $0.557$  inch.

TABLE VI.—*Month of August, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $6^{\circ}93$  below,  $0.093$  inch below,  $0.040$  ( $0-1$ ) above the respective means for the year. Very interesting in this case is the great similarity between the curves for pressure of air and positive atmospheric electricity. The greatest fall of rain during the month was  $0.431$  inch on the 11th.

TABLE VII.—*Month of September, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $6^{\circ}24$  below,  $0.095$  inch below,  $0.020$  ( $0-1$ ) above the respective means for the year. The barometrical curve shows two great depressions, viz., on the 14th and on the 23rd, both being due to heavy northerly gales. The greatest fall of rain during this month was  $0.489$  inch on the 11th.

TABLE VIII.—*Month of October, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $0^{\circ}01$  above,  $0.056$  inch above,  $0.026$  ( $0-1$ ) below the respective means for the year. The greatest fall of rain was on the 20th, viz.,  $0.494$  inch.

TABLE IX.—*Month of November, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity are respectively  $5^{\circ}29$  above,  $0.048$  inch below,  $0.056$  ( $0-1$ ) below the respective means for the year. In this case the scale for the height of the curve of temperature of air had to be reduced to half the size of the other months on account of the great range in this meteorological element. Heavy rain on the 13th, viz.,  $0.642$  inch; and on the 30th, viz.,  $0.950$  inch.

TABLE X.—*Month of December, 1858.*—The means for the month in temperature of air, pressure of air, and relative humidity, are respectively  $5^{\circ}67$  above,  $0.146$  inch below,  $0.062$  ( $0-1$ ) below the respective means for the year. Exceedingly interesting is the great depression in the barometrical curve on the 19th, on which day a heavy storm occurred (*See* page 166, section 149). Heavy rain on the 19th, viz.,  $1.623$  inch; on the 12th, viz.,  $1.417$  inch; on the 8th, viz.,  $1.125$  inch, and on the 20th, viz.,  $1.123$  inch.

TABLE XI.—*Month of January, 1859.*—The means for the month in temperature of air, pressure of air, and relative humidity are respectively  $9^{\circ}75$  above,  $0.072$  inch below,  $0.065$  ( $0-1$ ) below the respective means for the year. Heavy rain was observed on the 26th, viz.,  $1.156$  inch; and on the 9th, viz.,  $0.568$  inch.

TABLE XII.—*Month of February, 1859.*—The means for the month in temperature of air, pressure of air, and relative humidity are respectively  $7^{\circ}25$  above,  $0.073$  inch below,  $0.098$  ( $0-1$ ) below the respective Means for the year. In this case the same applies with reference to the scale of the height at the temperature curve as mentioned in the month of November.

TABLE XIII. represents the horary variations in temperature of air; the figures in the margin indicate the mean temperature of air at midnight for the different months. Some of the morning hours are repeated in order to show the continuation of the curve. Each part of division indicates one degree. The diurnal curves of temperature of air and temperature of surface soil for the whole year will be found at the foot of this table, the former being indicated by a plain line, the latter by a dotted one. The yearly means are entered correspondingly.

TABLE XIV. represents the diurnal curves of pressure of air for each month, each part of division signifying 0.010 of an inch. In cases of a rapid decrease or increase in the atmospheric pressure at the end of the month, considerable irregularities may be found in the curve between 11 p.m. and midnight, if simply the mean value for midnight is repeated, as is indicated by the dotted curve; to avoid this, the mean difference of the hours of 11 p.m. and midnight has been taken for each month and the result is shown by the plain curve. At the foot of this table two other curves are given, the one representing the diurnal oscillations of pressure of air, the other that of pressure of dry air.

TABLE XV. represents the diurnal curves for pressure of vapor for each month, each part of division signifying 0.010 of an inch; moreover, the mean diurnal curve for pressure of vapor, amount of cloud, and force of wind for the whole year. With regard to the two latter elements, particular attention may be drawn to the great regularity of the curves, showing for amount of cloud, 7<sup>h</sup> a.m. to be a maximum, and 9<sup>h</sup> p.m. a minimum; and for force of wind, 1<sup>h</sup> p.m. to be a maximum, and 1<sup>h</sup> a.m. a minimum.

TABLE XVI represents the horary variation in positive atmospheric electricity for each month, each part of division signifying one part of division of Quetelet's electrometer; the mean diurnal curve for the year is also represented. The last diagram represents the yearly mean number of hours of rain for each hour during the twenty-four, clearly showing a maximum for duration of rain at 2<sup>h</sup> a.m., and a minimum at noon.

The plates headed "Mean direction of the Wind," represent the motion of the mean direction of the wind, with the view of illustrating the law of the turning of the wind. The principle according to which these curves have been drawn, is simply this: the first day of the month is near the centre, the last at the circumference. Whenever the mean direction of the wind shifted in the sense N., W., S., E. (direct), it is indicated by a plain line, when it shifted in the sense N., E., S., W. (retrograde), by a dotted one. In cases where the mean direction of the wind shifted from one point of the compass to the opposite one, it was ascertained from the registers in which direction the turning took place: in all other cases it was adopted that it went the shorter route.

The plate headed "Windroses," contains the windroses for eight different meteorological elements; as these are derived from the tables in the paragraph having reference to this particular subject, there is no necessity for entering into any further explanation.

Attention may again be drawn to the remarks found in the introduction to this paragraph, with regard to the peculiarities of the site of the Observatory, and the irregularities in these curves caused by local influences.

# METEOROLOGY.

---

## I.—INTRODUCTION.

1. The observations made upon meteorological phenomena have been carried on without interruption since the 1st of March, 1858, the erection of the several buildings being then so far advanced as to admit of systematic labors being commenced in this department of the Observatory. The registrations were made every hour during the twenty-four, not excepting Sundays or holidays.

2. The instruments made use of were divided according to the methods prevalent on the Continent, which rendered necessary the subsequent reduction of the readings to English measure.

3. The barometer was of Fortin's construction, executed in the workshop of J. Lohmeier, in Hamburg. The scale of this instrument is divided into Parisian lines, tenths, and hundredths, and it was suspended as marine barometers usually are: the heavy cistern ensuring its perpendicularity. A thermometer, graduated according to Réaumur, was let into the brass tube of the barometer, which was placed in a room where it was carefully protected from sudden changes of temperature, the room itself being also well sheltered from the direct rays of the sun. The cistern was 120·7 feet above the mean level of the sea.

4. The index-error of this instrument was frequently checked by means of an excellent mountain barometer (Greiner, 111,) of Gay Lussac's construction, which had been compared with the standards of Munich, Berlin, and Hamburg; and also, after my arrival in this Colony, with the standard of the Meteorological Observatory in the offices of Crown Lands. The comparison of "Greiner, 111," with Professor Dove's standard at Berlin was effected on the 24th of June, 1856, and the correction was found to be  $-0\cdot10$  Parisian lines, which value was to be subtracted from the readings. A comparison with the Hamburg standard gave a similar result, namely  $-0\cdot05$  Parisian lines, while that made in Munich showed a slight difference; but as the latter place is much higher above the level of the sea (viz., 1660 Par. ft., = 1769 Eng. ft.) than the other localities and the Flagstaff Observatory, we may easily account for a slight difference, and adopt the values given above as the true correction for "Greiner, 111"—the more so as they exactly coincide with the quantities obtained from the comparison made with the standard of the Melbourne Meteorological Observatory in the year 1857.

With the help of this barometer, the correction for "Fortin, 108," was found to be almost constantly  $+0\cdot30$  Par. lines (=  $+0\cdot027$  inch).

5. The exact time of registering the barometer was one minute before the full hour.

6. The corrections applied to the readings were those for index-error, temperature, and capillary action.

7. The thermometers used were from the workshop of the Royal Observatory, Munich, and had been compared with the Munich and Kew standards. The index-errors of the several instruments were frequently re-examined and the corrections have been applied to the various readings. The scales were all divided into Réaumur degrees, and a reduction was consequently required to enable me to give the values according to Fahrenheit's division.

8. The standard thermometer used to determine the temperature of air in shade was attached to a stand similar to that constructed by Lawson, save that it is placed upon a platform about five feet high, whereby the bulb of the thermometer is raised nearly ten feet from the ground; a precaution very much to be recommended in a country like this, where the soil assumes so high a temperature. A flagstaff passed through both platform and stand, in such a way as to admit of the latter being turned round it.

9. Close to the standard, the thermometer was placed, which was used for obtaining the temperature of evaporation.

The following is the mode of observation:—The bulb of the thermometer is covered with gauze, which is moistened with water by means of a little spoon whenever an observation is to be made. The general rule which has been adopted is to moisten the bulb five minutes before the time of reading, this interval requiring occasional modification, according to wind and weather. After the moistening is effected, the stand is turned for a few seconds, so as to face the wind, whereby the air is made to circulate freely about the bulbs and through the air spaces of the stand, and the evaporation is facilitated in the first instance; the stand is then turned back to such a position that its face, bearing the instruments, is sheltered from the direct force of the wind as well as from the effects of the sun, and left undisturbed until the time of registration.

Care was taken at the the time of moistening this thermometer to remove any drop of water hanging from the bulb, and the gauze on the same was frequently renewed.

10. The pressure of vapor has been computed according to August's formula, viz:—

$$x = \frac{e - 0.0009729 d (b - c)}{1 + 0.001925 d}$$

$d$  signifies the psychrometrical difference,  $b$  the pressure of air, and  $e$  the tension of vapor for the temperature of the wet bulb, taken from M. Regnault's tables.

11. At the commencement of the year 1859 a hygrometer, according to Döbereiner-Regnault's construction, was placed on the meteorological stand beside the dry and wet bulb thermometers. With this instrument the dew-point could be determined at any moment with the utmost facility and accuracy, the aspirator made use of being kept continually full of water. The systematic registrations of the dew-point were made at midnight, 3 A.M., 6 A.M., 9 A.M., at noon, 3 P.M., 6 P.M., and 9 P.M.

12. The black bulb thermometer was exposed to the full action of the solar heat, without sheltering it from the action of the wind. To effect this the thermometer was supported by a light frame of wood, attached in such a way to an arm from the back of the stand as to admit of motion in every direction; the frame was also provided with a diopter, by means of which the thermometer could be placed at right angles to the direction of the sun's rays, a precaution which was considered necessary, as the blackened bulb was a long cylindrical one. In the tables will be found the maximum reading for those days on which the sun was visible.

13. The temperature of soil was taken with a horizontal thermometer, the bulb of which was just covered with sand, the same being fully exposed to the action of sun and wind.

14. The directions of the wind have been registered by the help of a very delicate weather vane, mounted on the top of the flagstaff which passes through the meteorological platform and stand. By means of a vertical quadrant, firmly attached to one of the sides of the moveable meteorological stand, the bearings of several objects in the distance, as viewed from the centre of the stand, have been frequently determined by observations of equal altitudes, while the circular plate on which the stand revolves acts the part of a limbus. By this arrangement the direction of the wind can be ascertained exactly, to within half a point; the observations will be found recorded from point to point.

15. To express the Force of Wind, Beaufort's notation has been used, viz., from 1 to 12; and in computing the Mean Direction of the Wind for the day, Lambert's formula has been employed, viz.:—

$$\text{Tang. } \phi = \frac{a + b \cos. 45^\circ 0' + c \cos. 22^\circ 30' + d \cos. 67^\circ 30'}{a + \beta \cos. 45^\circ 0' + \gamma \cos. 67^\circ 30' + \delta \cos. 22^\circ 30'}$$

The meaning of the various factors is well known to every one and does not require any further remark. The sense in which the mean direction is given is S. SE. E. NE. N. NW. W. SW. S. S. being equal to  $0^\circ$  or  $360^\circ$  and N.  $180^\circ$ . The "mean force," as given in the monthly abstract, represents only the mean of all registered forces, and is not the resultant belonging to the "mean direction." The "mean directions" and the resultants for the single months and for the year have been separately computed according to two different methods: first, according to Lambert's formula, the relative frequency of the winds being taken as components; secondly, according to the formula—

$$\text{Tang. } \phi = \frac{\Sigma (P \cdot \sin. \alpha)}{\Sigma (P \cdot \cos. \alpha)} \quad \text{and} \quad R = \sqrt{(P_o^2 + Q_o^2)}$$

wherein,  $Q_o = \Sigma (P \cdot \sin. \alpha) = P' \sin. \alpha' + P'' \sin. \alpha'' + \dots P^n \sin. \alpha^n$ ,

and,  $P_o = \Sigma (P \cdot \cos. \alpha) = P' \cos. \alpha' + P'' \cos. \alpha'' + \dots P^n \cos. \alpha^n$ .

16. In the month of November, 1858, an anemometer on Osler's principle was erected and registered, but from several imperfections in its construction greater reliance was placed upon the direct readings of the weather vane.

17. The Raingauge, placed seven feet above the ground, consisted of a copper vessel cased externally with wood, and offering an open horizontal section for the reception of the rain, of one square foot (Paris measure). The funnel terminated below in a glass tube, 18 inches long, which conveyed the water through a closely fitting cork, into a bottle the weight of which had been accurately determined. At six o'clock morning and evening, the bottle was removed and weighed, and from the weight of the water the height of the fall upon the square foot (English) was calculated and expressed in inches, tenths, &c. In addition to the determination of the rainfall, even when very slight, the quantities of precipitated moisture in the form of fog, dew, and hail, have by means of this instrument been frequently observed and noted.

18. The observations on atmospheric electricity were commenced on the 15th of April, 1858, the electrometer used being on Quételet's principle, improved by Lamont. The stand of this instrument was attached to a brick wall in such a way as to prevent the readings being influenced by any accidental vibration, and was at the same time so situated as to allow of the top of the electrometer being carried to and from a platform on the roof of the observatory with the least possible loss of time. The observations were taken by registering both ends of the needle, and by three readings on each side of the magnetic meridian. The first reading (a) was usually taken with the northward end of the needle diverging towards W.; the second (b) when it diverged towards E.; and the third (c) when the northward end was made to diverge towards W. again. The interval between the separate readings was one minute, measured with a sandglass, and the method of correcting the observations for index-error and loss were thus considerably simplified, viz.:—

$$\frac{a + c}{2} = n; \quad \frac{n + b}{2} = m; \quad a - c = \Delta; \quad m + \Delta = x; \quad x \text{ being the true tension.}$$

The electric tension was occasionally too large to admit of measurement; in such a case the endeavor was made to obtain a spark from the instrument, and the observation was recorded by using the sign  $\infty$ . The quality of the electric fluid contained in the insulated electrometer was ascertained by using a stick of sealing-wax excited by friction; the result checked when necessary by means of a glass bar similarly applied.

19. Schönbein's ozonometer was used in making observations on the ozonic reaction; the ozone paper was suspended in a tin box which admitted of a free circulation of air, but in which it was protected from the direct action of the sun's rays and from rain. The cylindrical box, nine inches high and four inches in diameter, was

hoisted to the top of the flagstaff, 33 feet above the ground. The ozone papers were exposed from 6 a.m. till 6 p.m., and from 6 p.m. till 6 a.m. From the 1st of November until the 1st March two more papers were exposed under the same circumstances, the one for three, the other for six hours, both commencing at midnight.

20. The form of clouds is given in Howard's nomenclature, and the amount of cloud in the usual way, registering the sky when clear as 0 and when completely overcast as 10, and estimating the intermediate amounts.

21. The situation of that portion of the ground within the Observatory enclosure occupied by Meteorological instruments, is the highest on the Flagstaff Hill; none of the buildings interfere in any way with a free circulation of air, nor does reflected light or heat act directly upon the thermometers so as to influence the reading.

## II.—DAILY ABSTRACT FOR THE YEAR ENDING 1st MARCH, 1859.

22. The year has been divided into periods of *five days* in accordance with the plan of the Meteorological Institute of Prussia. If six of these periods be taken as a meteorological month, commencing with the 1st of January, and we carry this arrangement strictly through the year, we shall find that the month of March begins with the 2nd and ends with the 31st, that of April coincides with the calendar month, and so on. By strictly adhering to this principle one period will be found to remain over at the end of the year, which has therefore been added on to the meteorological month of June, making it consist of seven periods.

23. The figures given in the single columns, under the heading "Mean," represent the means of twenty-four observations, or the results deduced from them, made during a day; the readings having been corrected in the manner described in the "Introduction."

24. The maxima and minima have not been obtained by observations made with self-registering instruments, but have been arrived at by immediate readings or by calculations based thereupon.

25. The direction of the wind is given with reference to the astronomical meridian, and the degrees and minutes are to be understood in the sense stated in the "Introduction." The column headed "Extremes" contains those points of the compass between which the vane oscillated on a given day; and it should be added that the vane is supposed to move "from" a certain point of the compass "to" another, through the mean direction, in the sense S. E. N. W. In cases where the vane went through 360°, "all round" will be found in the columns.

26. In calculating the means for atmospheric electricity, only the positive registrations were taken into consideration. When the quantity was too small to admit of measurement, but still distinctly appreciable, 0.5 parts of division was adopted as the value. The other two columns contain respectively the number of negative registrations and those when the tension was zero during the twenty-four hours; so, for instance, on the 20th April, 1858, positive electrical tension was recorded 23 times, the mean value of which amounted to 4.66 zero once, and negative tension not at all.

27. In the column headed "Remarks" everything worthy of particular notice is mentioned, and the duration of the phenomena is indicated by the figures enclosed in brackets.

28. The ozonic reaction is given according to Schönbein's scale, as above mentioned, and only those values were used in the monthly abstracts which were derived from observations made after twelve hours' exposure, viz., from 6 A.M. to 6 P.M. for the day, and from 6 P.M. to 6 A.M. for the night.

29. The means and sums for the month will be found recorded under the columns to which they refer, and upon the last two lines of each sheet are the means of the daily means, which represent 720 single observations; while the means of the extremes represent 30 readings, the month of June making an exception, wherein the means of the daily means represent 840, and those of the extremes 35 single readings.

30. These monthly abstracts are graphically represented in the plates of curves attached to this Report, remarks upon the nature and construction of which will be found in the paragraph "Explanation of Diagrams."

## 31. MONTH OF MARCH, 1858.

| DAY OF MONTH.   | TEMPERATURE OF AIR. |      |      | PRESSURE OF AIR. |         |         | PRESSURE OF VAPOR. |       |       | RELATIVE HUMIDITY. |

## MONTH OF MARCH, 1858—continued.

| AMOUNT<br>OF<br>RAIN. | REMARKS.                                                                                                                                    |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| ...                   | Fine weather. Horizon hazy. Wind, in evening, unsteady.                                                                                     |
| ...                   | Heavy dew (mid. to 7 a.m.) and (11 p.m.) Horizon very hazy. Veil clouds and ☾ Halo (diameter 42° 30')                                       |
| ...                   | (10 and 11 p.m.) ☾ Halo (midnight to 1 a.m.) Dew (mid. to 2 a.m.) Fog (5 a.m. to 8 a.m.)                                                    |
| ...                   | Very cloudy (3 a.m. to noon). ☾ Halo (11 p.m.) Dew (9 to 11 p.m.)                                                                           |
| ...                   | Very cloudy (mid. to 8 a.m.) Horizon hazy during day. Veil over sky in evening. ☾ Halo (11 p.m.) Dew (mid. 1 a.m.) (8 to 11 p.m.)           |
| ...                   | ☾ Halo (mid. to 5 a.m.) Dew (mid. to 8 a.m.) and (10 and 11 p.m.)                                                                           |
| ...                   | ☾ Halo, 40° 0' (2, 3 a.m.) Veil over sky (mid. to 1 p.m.) Sky overcast after noon.                                                          |
| ...                   | Very cloudy all day. Horizon very misty in the evening. Misty rain (7 a.m. to 11 a.m.) (9 and 11 p.m.)                                      |
| ...                   | Misty rain (mid. and 1 a.m.) Squally and clear in morning. Cloudy in the evening.                                                           |
| ...                   | Very clear all day.                                                                                                                         |
| ...                   | Very clear all day. Dew (4 to 7 a.m.) Dust storm (2 p.m.) Lightning in N.W. (7 to 10 p.m.)                                                  |
| ...                   | Lightning in W. and N.W. (2 to 4 a.m.) Pillar of dust very high (noon). Cloudy (1 to 5 p.m.) Fine night.                                    |
| ...                   | Dew (2 a.m.)                                                                                                                                |
| ...                   | Dew (6 a.m.) Fine clear night. Several columns of dust (1 p.m.) Heavy clouds (2 to 6 p.m.) Red sunset.                                      |
| ...                   | Lightning in W. (10 p.m.)                                                                                                                   |
| ...                   | Sky very clear all day. Clouds of dust from N.E. and N. (force of wind only) (2 to 3). Several columns of dust (2 p.m.)                     |
| ...                   | Sky very clear (mid. to 7 a.m.) Hot wind and dust (8 a.m. to 1 p.m.) Sky overcast and gloomy in afternoon and evening.                      |
| ...                   | Very cloudy all day. Rain (3 to 8 p.m.) (11 p.m.) Veil over sky, and clouds of dust (4 a.m. to 1 p.m.) Squally (9 p.m.)                     |
| ...                   | Rain (midnight). Squall (12.25 a.m.) (2 p.m.) Cloudy nearly all day. Fine golden sunset. Sky totally overcast (7 to 11 p.m.)                |
| ...                   | Sky overcast (mid. to 4 a.m.) Clear (6 a.m. to 11 p.m.) Dew (8 to 11 p.m.) 11 p.m., sky apparently clear, but stars not bright.             |
| ...                   | Sky very clear (mid. to 5 a.m.) Very cloudy (9 a.m. to 11 p.m.) Bush fires in W. and N.W.                                                   |
| ...                   | Very cloudy all day. Rain (10 a.m. to noon) (8 to 11 p.m.) Scud passing north (1 p.m.)                                                      |
| ...                   | Heavy rain (mid. to 2 a.m.) Rather cloudy in morning, rest of day fine. Zodiacal light (4 a.m.) Golden sunset.                              |
| ...                   | Sky very clear all day. Dew (1 to 6 a.m.) Zodiacal light (4 a.m.) No solar spots to be seen. Fine evening.                                  |
| ...                   | (10 and 11 p.m.) cloudy.                                                                                                                    |
| ...                   | Almost clear (1 to 4 a.m.) Rain (5 and 6 a.m.) (5 to 9 p.m.) Very cloudy all day.                                                           |
| ...                   | Very cloudy (mid. to noon), rest fine. Light rain (mid. to 9 a.m.), and (11 a.m.) Fine evening. Lightning in E. (8 p.m.)                    |
| ...                   | Cloudy (mid. to 2 p.m.) (9 to 11 p.m.) Fine (2 p.m. to 8 p.m.) Dew (1 a.m. to 3 p.m.) Rain (11 p.m.)                                        |
| ...                   | Cloudy (mid. to 2 a.m.) (2 p.m. to 7 p.m.) (10 p.m.) Fine (3 a.m. to 1 p.m.) Very clear. Dew (9 p.m.)                                       |
| ...                   | Clear (mid. to 5 a.m.) (10 to 11 p.m.) Cloudy (6 a.m. to 9 p.m.) Dew (mid. to 2 a.m.) (4 to 6 a.m.) Zodiacal light (5 a.m.) ☾ Halo (8 p.m.) |
| ...                   | Fine (mid. to 1 p.m.) (6 to 11 p.m.) Cloudy (2 to 5 p.m.) Heavy dew (mid. to 6 a.m.) (9 to 11 p.m.) Thin veil (8 and 9 a.m.)                |
| ...                   | Cloudy (4 to 6 a.m.) Rest of day fine and clear. Horizon rather hazy. Dew (mid. to 7 a.m.) (10 and 11 p.m.)                                 |
| ...                   | Sky clear until (2 p.m.) Rest cloudy. Dew (mid. to 7 a.m.) Wind squally. (2 p.m.) Dust rising.                                              |

## MONTH OF APRIL, 1858—continued.

| AMOUNT<br>OF<br>RAIN. | REMARKS.                                                                                                                                                    |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inches.               |                                                                                                                                                             |
| 0·0                   | Hot wind. Squally, dust rising (4 to 6 a.m.). Very red sunrise. Wind decreasing (9 a.m.) Wind shifted to South (1 p.m.) Dew (9 p.m.) Rather cloudy all day. |
| 0·0                   | Slight dew (1 to 4 a.m.) Fine (mid. to 4 a.m.) (noon to 5 p.m.)—the rest very cloudy. Squally and dusty (2 p.m.) Misty rain and squalls (10. to 11 p.m.)    |
| 0·023                 | Dull and cloudy (mid. to 1 p.m.) (9 to 11 p.m.) Fine afternoon. Lightning in North (8 p.m.)                                                                 |
| 0·0                   | Cloudy all day. ☾ Halo (2 a.m.) A few drops of rain at (2 p.m.)                                                                                             |
| 0·0                   | Dull and very cloudy all day. Misty rain (8 a.m.). Only a thin veil over the sky (11 p.m.)                                                                  |
| 0·027                 | Thin veil and ☾ Halo (mid.) Dew (1 a.m.) Rain (10 a.m. to 1 p.m.) (4 p.m. and 7 p.m.) Densely clouded all day, with misty rain and light variable winds.    |
| 0·003                 | Dull and overcast all day. Heavy squalls in afternoon. Rainbow at (5 p.m.) Rain (6 to 8, and 11 p.m.)                                                       |
| 0·008                 | Dull and overcast all day. Misty rain (noon, 3, 5, and 8 p.m.) Very squally and misty all day.                                                              |
| 0·031                 | Dull and overcast all day. Misty rain (2, 3, 6, 8, 10, and 11 a.m.) (5 and 6 p.m.) Veil over sky (4 a.m.) Earthquake in San Francisco.                      |
| 0·0                   | Pretty clear (3 to 9 a.m.) (7 to 11 p.m.) Dew (3 to 6 a.m.) Aurora Aust. (3 to 5 a.m.) ☉ Halo, 48° (3 to 4 p.m.) Thin veil over sky.                        |
| 0·003                 | Rather cloudy, Gusts of wind and clouds of dust (9 a.m. to noon). Misty rain (5 and 6 p.m.) (8 p.m.) Thin veil and lightning.                               |
| 0·0                   | Fine (mid. to 5 a.m.) and (7 to 9 p.m.) Dew (5 a.m.) Very cloudy (6 a.m. to 6 p.m., and 10 and 11 p.m.)                                                     |
| 0·0                   | Sky overcast all day until (9 p.m.)                                                                                                                         |
| 0·0                   | Fine cloudless day, but dull and hazy on the horizon.                                                                                                       |
| 0·0                   | Fine (mid. to 1 p.m.), rest rather cloudy. Dusty (8 to 11 a.m.) Dew (1 to 3 a.m.)                                                                           |
| 0·009                 | Dull and overcast all day until (11 p.m.) Rain (mid. and 1 a.m.)                                                                                            |
| 0·0                   | Sky clear all day. Horizon hazy. Dew (3 to 6 a.m.) and (11 p.m.) Zodiacal light (4h. 45m. a.m.)                                                             |
| 0·0                   | Cloudy (mid. to 7 p.m.), rest fine. Horizon hazy in morning, but clear in afternoon.                                                                        |
| 0·0                   | Fine day. Horizon hazy. Dew (3 to 5 a.m.)                                                                                                                   |
| 0·0                   | Cloudy (8 and 9 a.m.), the rest of day very clear. Dew (mid. to 7 a.m.) and (8 to 11 p.m.) Fog (7 to 9 a.m.)                                                |
| 0·0                   | Fine (mid. to 1 a.m.) and (8 a.m. to 11 p.m.) Fog (5 to 7 a.m.) Cloudy (2 to 7 a.m.) Horizon sometimes hazy.                                                |
| 0·0                   | Morning fine, afternoon and evening cloudy. Thunder in North (3 p.m.) Lightning in East all the evening.                                                    |
| 0·045                 | Sky densely overcast all day. Horizon misty. Steady light rain (2 to 4 a.m.) and (6 to 9 a.m.)                                                              |
| 0·0                   | Very cloudy (mid. to 10 a.m.), rest fine. Dew (10 to 11 p.m.) Horizon hazy all day. ☾ Halo (10 p.m.)                                                        |
| 0·0                   | Fine and clear. Dew (mid. to 6 a.m.) and (8 to 11 p.m.) Zodiacal light (5 a.m.) ☾ Halo (8 and 9 p.m.)                                                       |
| 0·0                   | Fine and clear. Dew (mid. to 5 a.m.) and (10 to 11 p.m.) Fog (5 to 9 a.m.) (6 to 9 p.m.) Zodiacal light (4h. 30m. a.m.) ☾ Halo (8 p.m.)                     |
| 0·003                 | Rather cloudy all day. Dew (mid. to 2 a.m.) Rain (7 and 8 a.m.) ☾ Halo and corona (7 p.m.)                                                                  |
| 0·209                 | Densely overcast. Rain (1 to 2 a.m.) (5 a.m. to noon) and (6 p.m.) ☾ Halo (6 p.m.), 43° diameter. Lightning in South (7 and 8 p.m.)                         |
| 0·008                 | Fine weather, amount of cloud very changeable. Rain (1 a.m.) ☾ Halo (4 a.m.)                                                                                |
| 0·172                 | Very cloudy (mid. to 6 p.m.) Fine clear evening. Rain (1 to 3, 5, and 7 a.m., and noon). Dew (10 and 11 p.m.) Very red sunset.                              |
| ...                   |                                                                                                                                                             |

## MONTH OF JANUARY, 1859—continued.

| AMOUNT<br>OF<br>RAIN. | REMARKS.                                                                                                                                                 |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inches.               |                                                                                                                                                          |
| 0.000                 | Fine. Horizon very clear in morning. Squally, with clouds of dust. ☉ Halo (2 to 6 p.m.) Whirlwinds (2 p.m.)                                              |
| 0.000                 | Densely overcast. Veil over the sky. ☉ Halo (11 a.m. to 1 p.m.)                                                                                          |
| 0.000                 | Fine (1 to 7 a.m.) and (2 to 11 p.m.) Veil over sky (10 p.m.)                                                                                            |
| 0.000                 | Clear (mid. to 6 a.m.) (noon to 11 p.m.) Dew (4 and 5 a.m.) Clouds of dust (3 p.m.) Rather stormy all day.                                               |
| 0.000                 | Very fine and clear. Traces of dew (1 a.m.) Cir. Cum. clouds dissolving and forming Cir. Str. veil passing South (3 p.m.)                                |
| 0.000                 | Very fine and clear. Dew (mid. to 5 a.m.) and (9 to 11 p.m.) Horizon dull and foggy.                                                                     |
| 0.000                 | Fine (mid. to 6 p.m.) Heavy dew (mid and 1 a.m.) (4 and 5 a.m.) Windtrees and veil (noon to 2 p.m.) ☉ Halo (11 a.m. and 3 p.m.)                          |
| 0.039                 | Densely clouded. Rain (1 to 8 a.m.) Horizon hazy. Thunder (at 3 p.m.) towards North.                                                                     |
| 0.513                 | Very cloudy (until 9 p.m.) Dew (2 to 4 a.m.) Rain (5 a.m.) (2 to 9 p.m.) Fog (3 a.m.) Thunder (1 p.m.) in North. Thunder and lightning in East (10 p.m.) |
| 0.162                 | Fine (5 to 10 a.m.), the rest very cloudy. Rain (3 a.m.) (3, 5, and 6 p.m.) Heavy squall (at 5h. 20m. p.m.) and (9 p.m.)                                 |
| 0.004                 | Densely overcast. Rain (9 a.m. to 3 p.m.) Squally in the morning.                                                                                        |
| 0.113                 | Cloudy (mid. to 5 p.m.) Evening very clear. Rain (5 to 10 a.m.) Dew (11 p.m.)                                                                            |
| 0.000                 | Fine. Dew (mid. to 4 a.m.) and (11 p.m.)                                                                                                                 |
| 0.000                 | Overcast (mid. to 10 a.m.), the rest of the day very fine.                                                                                               |
| 0.000                 | Fine (mid. to 7 a.m.) Dew (5 a.m.) Rain (8 to 11 p.m.) Veil (6 a.m.) Rainbow (7 p.m.)                                                                    |
| 0.273                 | Fine (4 to 8 p.m.) Rain (mid. to 1 p.m.) Veil, windtrees, and ☉ halo (6 p.m.) Lightning all the evening in W. and S.W.                                   |
| 0.001                 | Cloudy. Rain (mid.) Thunder and lightning in N.E. (mid. to 3 a.m.) Very close and sultry. Heavy thunder clouds (3 p.m.)                                  |
| 0.164                 | Cloudy (mid. to 6 a.m.) Very fine (7 a.m. to 11 p.m.) Rain (2 and 3 a.m.) Squalls and dust in the afternoon.                                             |
| 0.017                 | Fine (mid. to 6 a.m.), the rest of the day very cloudy. Rain (noon, 3 p.m., 6 p.m., and 8 p.m.)                                                          |
| 0.000                 | Very cloudy (until 2 p.m.) Rain (5 a.m.) Wind rather squally during the night. Afternoon and evening fine.                                               |
| 0.000                 | Fine day. Dew (2 to 5 a.m.) Sky particularly clear in the evening.                                                                                       |
| 0.000                 | Fine and clear (mid. to 1 p.m.) Dull and cloudy (2 to 11 p.m.) Slight dew (mid. to 5 a.m.) Hot wind (8h. 45m. a.m. to 6 p.m.)                            |
| 0.095                 | Very cloudy. Lightning all the morning towards the West. Thunder storm (2 to 4 p.m.) Rain (7 a.m.) (1 to 6 p.m.)                                         |
| 0.000                 | Cloudy. Veil and windtrees. ☉ Halo (4 a.m.) Lightning all the evening in N.W.                                                                            |
| 0.110                 | Very cloudy (mid. to 6 p.m.) Rain (9 and 10 a.m.) (noon to 2 p.m.) Fine evening. Lightning in N.W.                                                       |
| 1.043                 | Very cloudy. Rain (7 a.m. to 11 p.m.) ☉ Halo (2 and 4 a.m.) Thunder in N. and W. (at noon).                                                              |
| 0.048                 | Fine (mid. to 6 a.m.) and (noon to 11 p.m.) Dew (mid., 1, 2 to 4 a.m.) Fog (7 a.m.) Rain (9 and 10 a.m.) Veil (9 and 10 p.m.)                            |
| 0.000                 | Fine. Dew (2 to 4 a.m.) ☉ Halo (1 and 2 a.m.) Veil and windtrees all day. ☉ Halo (11 a.m. to 1 p.m.) and (4 p.m.)                                        |
| 0.000                 | Fine morning, rest very cloudy. Dew (3 to 5 a.m.) Rain (8 and 11 p.m.) Wind light and unsteady.                                                          |
| 0.000                 | Very cloudy (until 3 p.m.), the rest fine. Wind light but squally. Sky exceedingly clear in the evening.                                                 |
| ...                   |                                                                                                                                                          |
| 2.582                 |                                                                                                                                                          |

## MONTH OF FEBRUARY, 1859—continued.

| AMOUNT<br>OF<br>RAIN. | REMARKS.                                                                                                                                                                                         |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inches.               |                                                                                                                                                                                                  |
| 0.000                 | Very fine and clear. Dew (3 to 5 a.m.) Veil and windtrees.                                                                                                                                       |
| 0.000                 | Very fine and clear. Dew (1 to 6 a.m.)                                                                                                                                                           |
| 0.000                 | Very fine and clear. Horizon hazy. Rose color radial streaks observed at sunset.                                                                                                                 |
| 0.000                 | Very fine and clear. Dew (mid to 5 a.m.) Hot wind and clouds of dust (8 a.m.) ☉ Halo (3 and 5 p.m.)                                                                                              |
| 0.000                 | Very fine and clear. Dew (9 to 11 p.m.) Veil (2 a.m.) Horizon hazy.                                                                                                                              |
| 0.000                 | Fog (4 a.m. to noon), the rest very fine and clear. Dew (mid. to 3 a.m.) Dark red sunset.                                                                                                        |
| 0.000                 | Fine (mid. to 4 p.m.), the rest very fine and clear. Heavy squalls, with clouds of dust and small whirlwinds, in the evening. A cold wind from S., with gusts of hot air frequently perceptible. |
| 0.000                 | Very cloudy (mid. to 11 a.m.) Light squalls. Dull and hazy. Rest of day fine.                                                                                                                    |
| 0.000                 | Very cloudy all day. Veil (6 a.m.) Solar rays (5.30 a.m.) Wind changeable.                                                                                                                       |
| 0.202                 | Fine (mid. to 5 a.m.), rest cloudy. Rain (noon to 8 p.m.) and (11 p.m.) Very squally in afternoon.                                                                                               |
| 0.049                 | Cloudy (4 a.m. to 3 p.m.), the rest fine. Dew (3 a.m.) Misty rain (7 to 11 a.m.) Aurora Aust. (10 p.m.)                                                                                          |
| 0.000                 | Fine and clear (mid. to 6 a.m.) (9 to 11 p.m.) Heavy dew (mid to 5 a.m.) Rain (6 to 8 p.m.) Heavy squalls and clouds of dust.                                                                    |
| 0.152                 | Cloudy. Rain (6 to 8, and 10 p.m.) Heavy squalls (3 p.m.) Wind very unsteady.                                                                                                                    |
| 0.069                 | Fine day, rather cloudy. Veil and ☉ Halo (6 p.m.) ☾ Halo (9, 10, and 11 p.m.)                                                                                                                    |
| 0.000                 | Fine day, rather cloudy. Veil and ☉ Halo (9 a.m. to 1 p.m.) Dew (3 to 5 a.m.)                                                                                                                    |
| 0.000                 | Cloudy. Rain (noon, 9 to 11 p.m.) Light squalls in morning.                                                                                                                                      |
| 0.097                 | Fine (2 to 8 a.m.), the rest very cloudy. Rain (mid. 1 a.m., and noon.) Dew (2 to 6 a.m.)                                                                                                        |
| 0.000                 | Fine. Dew (mid. to 6 a.m.) Squally (10 a.m.) (3, 4, & 11 p.m.) Total eclipse ☾ (8.21 p.m.)                                                                                                       |
| 0.000                 | Very fine. Dew (3 to 6 a.m.) Fog (7 and 9 a.m.) Veil and ☾ Halo (diameter 50°).                                                                                                                  |
| 0.000                 | Very cloudy (mid. to 11 a.m.) Fine (noon to 11 p.m.) ☾ Halo (mid. to 2 a.m.)                                                                                                                     |
| 0.000                 | Very fine (mid. to 1 p.m., 7 to 10 p.m.) Hot wind and clouds of dust (9 a.m. to 4 p.m.) Lightning towards N.W. (7 and 8 p.m.)                                                                    |
| 0.037                 | Very cloudy. Rain (5, 6, and 8 a.m.) and (4 to 6 p.m.) Lightning in W. (3 a.m.) Thunder and lightning in North (4 a.m.)                                                                          |
| 0.022                 | Very cloudy. Rain (9 and 10 a.m.) and (10 p.m.) ☾ Halo (mid., 1, and 3 a.m.)                                                                                                                     |
| 0.000                 | Rather cloudy. Dew (3 and 4 a.m.) Rain (6 p.m.) Squally.                                                                                                                                         |
| 0.113                 | Morning rather cloudy. Afternoon very fine. Heavy showers and slight squalls (mid. and 1 a.m.) Traces of an Aurora (10.15).                                                                      |
| 0.000                 | Cloudy. Light breeze all day. Squally in evening.                                                                                                                                                |
| 0.000                 | Cloudy night. Fine day. Light squalls. Cloudy again (8 to 11 p.m.)                                                                                                                               |
| 0.000                 | Cloudy (9 a.m. to 3 p.m.), rest very fine. Dew (3 to 5 a.m.) Aurora Aust. (12.25 a.m.) ☉ Halo (3 p.m.)                                                                                           |
| 0.000                 | Sky beautifully clear. Fata Morgana over bay (3 p.m.)                                                                                                                                            |
| 0.005                 | Very cloudy. Lightning in West (5 a.m.) Hot wind and dust (7.15). Rain (1, 2, 9, and 10 p.m.) Considerable oscillations in pressure of air.                                                      |
| ...                   |                                                                                                                                                                                                  |
| 0.746                 |                                                                                                                                                                                                  |

### III.—DIURNAL VARIATIONS OF THE PRINCIPAL METEOROLOGICAL ELEMENTS FOR EACH MONTH OF THE YEAR, ENDING 1ST MARCH, 1859.

43. The several Tables designed to illustrate the diurnal variations in the different meteorological elements, are as follow :—

- (I.) Hourly Variation in Temperature of Air.
- (II.) „ Pressure of Air.
- (III.) „ Pressure of Vapor.
- (IV.) „ Pressure of Dry Air.
- (V.) „ Temperature of Surface Soil.
- (VI.) „ Force of Wind.
- (VII.) „ Amount of Cloud.
- (VIII.) „ Atmospheric Electricity (pos.)
- (IX.) „ Hours of Rain.
- (X.) Diurnal Curve of the Principal Meteorological Elements.

The figures given in the Tables I. to VIII. represent the means of the observations for each hour during each calendar month, and are consequently the results derived from 30 or 31 readings, as the case may be.

44. The values given in Table IX. are the sums of the periods of rain for each hour in each month respectively ; thus, in the month of November, for midnight we find 2·8, which signifies that in that month out of the 30 hours, between 11 p.m. and midnight, 2·8 hours have been rainy. In Table X. the figures given represent the means of 365 observations, taken at the same hour.

45. *Temperature of Air.*—The amplitude in the diurnal variation of this element for the several months of the year is as follows :—

| 1858.            | DEGREES. | 1858.           | DEGREES. |
|------------------|----------|-----------------|----------|
| March ... ..     | 17·37    | October ... ..  | 16·94    |
| April ... ..     | 15·64    | November ... .. | 17·84    |
| May ... ..       | 11·95    | December ... .. | 18·92    |
| June ... ..      | 13·23    | 1859.           |          |
| July ... ..      | 10·62    | January ... ..  | 14·90    |
| August ... ..    | 12·53    | February ... .. | 19·39    |
| September ... .. | 11·90    |                 |          |

The mean amplitude of the diurnal variations for the year is therefore 15·10.

46. *Pressure of Air.*—The amplitude in the diurnal variation for the different months, is as follows :—

| 1858.            | INCHES. | 1858.           | INCHES. |
|------------------|---------|-----------------|---------|
| March ... ..     | 0·067   | October ... ..  | 0·076   |
| April ... ..     | 0·063   | November ... .. | 0·072   |
| May ... ..       | 0·062   | December ... .. | 0·073   |
| June ... ..      | 0·055   | 1859.           |         |
| July ... ..      | 0·045   | January ... ..  | 0·071   |
| August ... ..    | 0·053   | February ... .. | 0·072   |
| September ... .. | 0·055   |                 |         |

The mean amplitude in the diurnal variation for the year, amounts to 0·064 inches.

These results have not been reduced to the level of the sea.

47. *Pressure of Vapor.*—The amplitude of the diurnal variation for each month throughout the year is as follows :—

| 1858.            | INCHES. | 1858.           | INCHES. |
|------------------|---------|-----------------|---------|
| March ... ..     | 0·049   | October ... ..  | 0·051   |
| April ... ..     | 0·042   | November ... .. | 0·062   |
| May ... ..       | 0·044   | December ... .. | 0·047   |
| June ... ..      | 0·048   |                 |         |
| July ... ..      | 0·040   | 1859.           |         |
| August ... ..    | 0·037   | January ... ..  | 0·058   |
| September ... .. | 0·039   | February ... .. | 0·044   |

Consequently the mean diurnal amplitude amounts to 0·047 inches.

48. *Pressure of Dry Air.*—The amplitudes of the diurnal variations are as follow :—

| 1858.            | INCHES. | 1858.           | INCHES. |
|------------------|---------|-----------------|---------|
| March ... ..     | 0·079   | October ... ..  | 0·094   |
| April ... ..     | 0·077   | November ... .. | 0·094   |
| May ... ..       | 0·075   | December ... .. | 0·090   |
| June ... ..      | 0·070   |                 |         |
| July ... ..      | 0·062   | 1859.           |         |
| August ... ..    | 0·073   | January ... ..  | 0·105   |
| September ... .. | 0·070   | February ... .. | 0·097   |

The mean value for the year is therefore 0·082 inches.

49. *Temperature of Soil.*—The amplitudes of the diurnal variations are for the several months as follow :—

| 1858.            | DEGREES. | 1858.           | DEGREES. |
|------------------|----------|-----------------|----------|
| March ... ..     | 33·39    | October ... ..  | 48·74    |
| April ... ..     | 24·98    | November ... .. | 46·19    |
| May ... ..       | 16·03    | December ... .. | 43·94    |
| June ... ..      | 15·87    |                 |          |
| July ... ..      | 14·63    | 1859.           |          |
| August ... ..    | 22·12    | January ... ..  | 38·14    |
| September ... .. | 23·18    | February ... .. | 49·53    |

The mean value for the year consequently amounts to 31·40 degrees.

50. A more minute description of the peculiarities of the curves of the various elements is given under the heading “Explanation of Diagrams,” attached to this Report.

## IV.—WIND.

51. The results of the anemometer in use at the Observatory were not taken into consideration in computing the following values, chiefly because the light winds were not indicated by this instrument with the degree of accuracy required in investigations of so minute a nature. A little weathervane was used, which is placed in a position already described in the Introduction.

52. On examining the wind registrations hour by hour, we find the number of hours during which it blew from each point of the compass, as given in the following table. It was thought advisable to combine, in eight single columns, all the winds between S. and S.E., S.E. and E., E. and N.E., N.E. and N., N. and N.W., N.W. and W., W. and S.W., and S.W. and S., because errors of observation are more likely to occur in determining the direction of the wind when the vane stands at those intermediate points, and the cardinal points will, generally, be too largely represented.

## 53. NUMBER OF HOURS DURING WHICH THE WIND BLEW FROM EACH POINT OF THE COMPASS.

54. In perusing this table, the number of hours in each period must be taken into consideration; and it must be understood that the months meant here are not taken with regard to the five-day means, and are consequently the civil months, containing the number of hours accordingly. It is the same with regard to the number of hours in each quarter, the two first containing 92 days, the third 90, and the fourth 91.

The number of lost observations during the year are 16 only, and if we distribute these equally over the four quarters we find, from the above tables, that we had in the

|             |     |     |     |                    |
|-------------|-----|-----|-----|--------------------|
| 1st Quarter | ... | ... | ... | 52 hours of calms, |
| 2nd „       | ... | ... | ... | 10 „ „             |
| 3rd „       | ... | ... | ... | 10 „ „             |
| 4th „       | ... | ... | ... | 97 „ „             |

We understand here by “calms” those hours in which no breath of air was perceptible, after having used all possible means of discovering it. The number of hours for the year in which it was absolutely calm amounts to 169.

55. If the figures given in the above table are reduced to their relative values, by dividing the number in each quarter by the smallest number of hours in that quarter, or, for the year, by dividing by the smallest number of hours in the year, we obtain the following results:—

|             |     | S.  | Between<br>S.<br>and<br>S.E. | S.E. | Between<br>S.E.<br>and<br>E. | E.  | Between<br>E.<br>and<br>N.E. | N.E. | Between<br>N.E.<br>and<br>N. | N.   | Between<br>N.<br>and<br>N.W. | N.W. | Between<br>N.W.<br>and<br>W. | W.  | Between<br>W.<br>and<br>S.W. | S.W. | Between<br>S.W.<br>and<br>S. |

56. The mean directions of the wind for the several months, for each quarter, and for the year, have been computed according to the principles mentioned in the Introduction to this Report, and of which I need give no further explanation.

The mean directions and resultants for each month are as follow:—

|           |     |     | MEAN DIRECTION. |     | RESULTANT. |
|-----------|-----|-----|-----------------|-----|------------|
| 1858.     |     |     | °               |     |            |
| March     | ... | ... | S. 47 36 E.     | ... | 128.0      |
| April     | ... | ... | S. 342 48 E.    | ... | 29.7       |
| May       | ... | ... | S. 165 13 E.    | ... | 256.9      |
| June      | ... | ... | S. 172 36 E.    | ... | 374.6      |
| July      | ... | ... | S. 199 54 E.    | ... | 341.9      |
| August    | ... | ... | S. 215 15 E.    | ... | 283.8      |
| September | ... | ... | S. 234 57 E.    | ... | 324.1      |
| October   | ... | ... | S. 326 32 E.    | ... | 142.8      |
| November  | ... | ... | S. 5 6 E.       | ... | 112.7      |
| December  | ... | ... | S. 332 57 E.    | ... | 124.9      |
| 1859.     |     |     |                 |     |            |
| January   | ... | ... | S. 349 13 E.    | ... | 49.2       |
| February  | ... | ... | S. 344 23 E.    | ... | 128.4      |

The following numbers show the values for the quarters:—

|             |     |     | MEAN DIRECTION. |     | RESULTANT. |
|-------------|-----|-----|-----------------|-----|------------|
|             |     |     | °               |     |            |
| 1st Quarter | ... | ... | S. 129 45 E.    | ... | 210.4      |
| 2nd „       | ... | ... | S. 193 31 E.    | ... | 956.8      |
| 3rd „       | ... | ... | S. 279 40 E.    | ... | 330.2      |
| 4th „       | ... | ... | S. 342 44 E.    | ... | 297.4      |

57. The mean direction and resultant for the year have been computed from the results of all the months, from those of the quarters, and directly from the table of frequencies given above, and the results arrived at were found to correspond very well with one another. The following numbers show the mean of the three calculations :—

|                                | DIRECTION.    | RESULTANT.   |
|--------------------------------|---------------|--------------|
| The year ending February, 1859 | S. 213°54' E. | 874.0 hours. |

The Resultant of all the winds that blew over Melbourne in the course of the year is therefore equivalent to a wind blowing from N. 33°54' W., with an average force of 2.32, during 874 hours or 36 days.

58. Although results based on the actual measurement of the force or velocity of the wind, have comparatively a much greater value than those derived from merely guessing it, it is, nevertheless a matter of great importance, in the absence of the former, to express the relative force as accurately as possible by the latter method : for this reason the following tables have been compiled.

By simply taking the mean force of the winds for each month, we obtain the following results; expressed according to Beaufort's notation :—

| 1858.     |     |     |      | 1858.                    |     |     |      |
|-----------|-----|-----|------|--------------------------|-----|-----|------|
| March     | ... | ... | 1.48 | November                 | ... | ... | 2.54 |
| April     | ... | ... | 1.80 | December                 | ... | ... | 2.32 |
| May       | ... | ... | 1.93 |                          |     |     |      |
| June      | ... | ... | 2.07 | 1859.                    |     |     |      |
| July      | ... | ... | 2.65 | January                  | ... | ... | 2.62 |
| August    | ... | ... | 3.02 | February                 | ... | ... | 2.35 |
| September | ... | ... | 2.76 |                          |     |     |      |
| October   | ... | ... | 2.39 | For the year the mean is | ... | ... | 2.32 |

59. The hourly observations on the motions of the weather-vane have been discussed with the view of illustrating Dove's law of the turning of the winds. The principal results in connection therewith are contained in the following tables.

If we call the revolutions of the weather-vane in the sense S.E.N.W.S., *direct*; and those in the sense S.W.N.E.S., *retrograde*; and arrange in their respective columns the number of points through which the vane moved in each direction, we obtain the following remarkable facts.

60. Table showing the excess of Direct revolutions over the Retrograde ones, for each month and quarter :—

| 1858.              |     |     |     | 1858.              |     |     |     |
|--------------------|-----|-----|-----|--------------------|-----|-----|-----|
| DIRECT REVOLUTION. |     |     |     | DIRECT REVOLUTION. |     |     |     |
| March              | ... | ... | 9.2 | October            | ... | ... | 1.5 |
| April              | ... | ... | 4.2 | November           | ... | ... | 3.3 |
| May                | ... | ... | 2.1 | December           | ... | ... | 6.2 |
| June               | ... | ... | 2.6 |                    |     |     |     |
| July               | ... | ... | 3.5 | 1859.              |     |     |     |
| August             | ... | ... | 1.8 | January            | ... | ... | 4.8 |
| September          | ... | ... | 6.2 | February           | ... | ... | 2.8 |

These figures show the vane to have made 48.2 direct revolutions in excess of the retrograde; *i.e.* to have moved through 1542.4 points more in the sense S.E.N.W.S. than in the sense S.W.N.E.S.

|         |             |                         |     |     |     |              |
|---------|-------------|-------------------------|-----|-----|-----|--------------|
| For the | I. quarter, | March to May            | ... | ... | ... | 15.5 direct. |
| "       | II.         | " June to August        | ... | ... | ..  | 7.9 "        |
| "       | III.        | " September to November | ... | ... | ... | 11.0 "       |
| "       | IV.         | " December to February  | ... | ... | ... | 13.8 "       |

61. These mean directions of the wind have been discussed with one object in view, a more elaborate explanation of which will be given in the description of the diagrams attached.

## 62. WINDROSES.

It forms a part of the system adopted at the Flagstaff Observatory, that all the results of observations, made with the various meteorological instruments, are copied and classified according to the direction of the wind. The forms prepared to receive these results contain—columns for pressure of air and vapor, temperature of air, amount of clouds, duration of rain (in hours), force of wind, atmospheric electricity, ozone—and besides these, a column in which is noted the hour at which the observation was made, in order that one might know what correction to apply to the means for the horary variations in each element.

The following tables contain the above mentioned means, for the different elements :—

## 63. MEAN FORCE OF WIND FOR EACH POINT OF THE COMPASS.

| DIRECTION<br>OF<br>WIND. | FOR THE QUARTER. |                  |                       |                       | FOR THE<br>YEAR. | DIRECTION<br>OF<br>WIND. | FOR THE QUARTER. |                  |                       |                       | FOR THE<br>YEAR. |

64. From the tables of the means of the different meteorological elements for each point of the compass windroses have been constructed, for the pressure of air, temperature of air, pressure of dry air, pressure of vapor, and positive atmospheric electricity.

In computing these values the results were again reduced to sixteen points of the compass, all those observations having been combined which lay between S. and S.E., S.E. and E., E. and N.E., N.E. and N., N. and N.W., N.W. and W., W. and S.W., and S.W. and W. By this means, the errors arising from an inequality in the number of observations on different points of the compass are, to some extent, eliminated; the rest of the method of calculation is identical with that given by M. Kaemtz in his "Complete Course of Meteorology."

65. These "cards" have been made up for the quarters and the year. Tables containing the number of hours during which the wind blew from each point of the compass were used in bringing the relative frequency of the winds into consideration.

71. In the description of the Diagrams I have alluded to some facts derivable from investigations similar to those of which I have just treated, by the construction of curves representing the main features of the above tables. One can scarcely lay too much stress upon the value of labors of this kind, and it may be safely asserted that we can only secure the proper discussion of such an enormous quantity of observations by at once reducing and classifying them, as is at present done in this observatory, for otherwise, they would in a short time accumulate to such an extent that the very idea of reducing them would almost dishearten one.

72. Before closing the chapter on the winds, and their effect on the various meteorological instruments, I should have liked to insert some results of the investigations that are being conducted here, concerning the storms, &c., on this coast; but I have refrained from so doing, being convinced that the results will be much more satisfactory and definite when the observations, from which they are reduced, shall have extended over a more protracted period.

## V.—AQUEOUS METEORS.

73. If  $I$  denotes the intensity of rain,  $D$  its duration, and  $A$  the amount collected, the following formula express a relation between these quantities,  $I = \frac{A}{D}$ .

According to this formula the values for the intensity, which appear in the following table, have been computed.

It was stated in the introduction, that the amounts of rain have been invariably measured at 6 P.M. and at 6 A.M., and the figures given under the heads "day and night," represent the amounts collected during twelve hours.

The intensity column shows the intensity of rain for day and night, as well as the mean value. This mean value is also expressed in units of the lowest intensity in the month of June.

As in March, 1858, the standard raingauge had not been in working order, no observations could be made with regard to the fall of rain in night and day, and consequently the column for intensity could not be filled up; for the completion of the observations in this month the amount of rain was used, which was collected at the late Meteorological Observatory at the Crown Lands Office.

74. RAIN TABLE FOR THE YEAR ENDING 1ST OF MARCH, 1859.

| PERIODS.        | AMOUNT. |         |         | NUMBER OF HOURS. |        |        | INTENSITY. |        |       |           |

75. Particular attention has been paid to the relation between the duration of rain and the direction of wind. The following tables contain the results arrived at:—Table 76 shows the number of hours of rain for each point of the compass for each month; and Table 77, the number of hours of rain for the directions of the wind stated in the first column, (*vide* Description of Diagrams).

76. NUMBER OF HOURS OF RAIN FOR EACH POINT OF THE COMPASS  
FOR EACH MONTH.

## VI.—OZONE.

81. The manner and nature of the instrument by which the observations on Ozone have been carried on throughout the year ending 1st March, 1859, have been described in the introduction, and there is little to add for the explanation of the following tables.

The first contains the results of observations made on the ozonic reaction, the papers having been exposed through three, six, and twelve hours, and furnish a means by which conclusions may be drawn as to the diurnal variations in this element, as to the ratio of ozonic action, and the multiplied time of exposure.

82. The results obtained from this complete plan of observations do not appear to lead to distinct conclusions with regard to the horary variations in the ozonic reaction; however, they have been made with great care and precaution, and deserve all confidence. The means deduced from the four months—November, 1858, to February, 1859—turn out more determined, as can be seen by inspecting the respective tables.

83. TABLE SHOWING THE VARIATIONS IN THE AMOUNT OF OZONE FOR THE PERIODS OF THREE, SIX, AND TWELVE HOURS, FOR THE MONTHS OF NOVEMBER AND DECEMBER, 1858, AND JANUARY AND FEBBUARY, 1859.

| MONTHS.                        | PERIODS. |                 |     |     | AMOUNT OF OZONE PAPER EXPOSED DURING |          |           | RATIO OF THE OZONIC REACTION DURING<br>3, 6, AND 12 HOURS.                       |             |              |

86. An ozonic wind-card has been constructed, by simply taking the means of the different observations for each wind, which means will be found in Table 87. It must be mentioned, however, that the observations had to be divided into two classes, inasmuch as they were registered at different hours, in different parts of the year, as below stated. In the period from March to October, 1858, observations were only made at intervals of twelve hours each, viz., from six a.m. to six p.m., but in that from November, 1858, to February, 1859, in addition to the twelve-hourly ones above mentioned, there were others made at intervals of three and six hours, which were used in compiling the following tables. In order to obtain a more comprehensive view of the relations between wind and ozone, the figures have been divided by the smallest quantity in each column and multiplied by ten, so that they express only relative values.

## 87. MONTHLY MEANS OF OZONE FOR EACH POINT OF THE COMPASS.

## VIII.—THE ZODIACAL LIGHT.

90. Particular attention was paid to this interesting phenomenon, and whenever an opportunity offered itself, observations were made with a view to ascertain the limits of the luminous column, by tracing them upon a good map of stars. The number of days on which complete and reliable observations could be taken, has not been as great as we might expect from the geographical position of this country and the brightness of the sky; but it may be stated here, that the cirro stratus veil, so peculiar to our climate, greatly interfered with these interesting investigations, and frequently when the light of the phenomenon was very intense, the upper extremity of the column, and its limits, could not be registered with any degree of accuracy. Great precaution was taken that the eye of the observer should not be affected by surrounding lights, or by brilliant stars, whenever an accurate determination of the position of its boundaries was intended.

91. I fully agree with the view of Dr. Julius Schmidt, one of the most experienced observers in this matter, when he states that every observer of the zodiacal light will most probably trace its limits differently, according to the sensitiveness of his eye, and his own experience; but at the same time I believe that an observer can arrive at very good results, after having decided upon a particular part as the limits of the phenomenon. When observing under favorable circumstances, I was frequently induced to believe, that I could clearly discern an inner and an outer phenomenon, so much so that I have had to alter the outlines several times before I could confine them to the compass which I generally adopt.

92. The following is an extract from the register which was kept during the years 1858–59, containing an enumeration of the days when the zodiacal light was visible, as well as the more accurate observations on its position :—

*March the 6th at 7 p.m.* The zodiacal light was visible in the west, not very well defined on account of a thin veil of clouds.

*March the 16th at 4 a.m.* The zodiacal light was not very bright, although the upper extremity could be seen with some certainty in an altitude of  $60^{\circ}$ . The greatest width of the column, did not exceed  $7^{\circ} 30'$

*March the 23rd at 4 a.m.* The zodiacal light very bright.

*March the 27th at 4 a.m.* The zodiacal light very intense; but the base was enveloped in a bank of heavy clouds.

*March the 28th at 5 a.m.* The zodiacal light visible.

*April the 19th at 4.45 a.m.* The zodiacal light very bright, but cirri did not admit of any accurate observations.

*April the 22nd at 5 a.m.* The zodiacal light visible.

*April the 25th at 5 a.m.* The zodiacal light visible, but sky not very clear.

*April the 26th at 4.30 a.m.* The zodiacal light very bright.

*May the 17th at 4 a.m.* The zodiacal light very bright, but diffused on account of the cirro cumulus clouds.

*May the 15th at 5.15 a.m.* The sky was perfectly clear, and the zodiacal light splendidly visible. The upper extremity was near a point situated in a line connecting  $\lambda$  Aquarii and Deneb Knitos about three-eighths of the whole distance from the latter star. The southern edge was well defined, while the northern was more difused. The results of the observations are as follow :—

|    |     |     |      |     | SOUTHERN.            | NORTHERN LIMITS. |     |        |
|----|-----|-----|------|-----|----------------------|------------------|-----|--------|
| AR | ... | ... | 355° | ... | $d = - 12^{\circ}.5$ | ...              | ... | — —    |
| "  | ... | ... | 360° | ... | $d = - 11^{\circ}.5$ | ...              | ... | — —    |
| "  | ... | ... | 15°  | ... | $d = - 7^{\circ}.0$  | ...              | ... | + 7°.  |
| "  | ... | ... | 25°  | ... | $d = - 3^{\circ}.0$  | ...              | ... | + 10°. |
| "  | ... | ... | 30°  | ... | $d = - 2^{\circ}.0$  | ...              | ... | + 20°. |
| "  | ... | ... | 35°  | ... | $d = - 1^{\circ}.0$  | ...              | ... | + 27°. |

*June the 3rd at 8 p.m.* The zodiacal light visible on the western horizon.

*June the 4th at 7 p.m.* The zodiacal light visible on the western horizon.

*June the 10th at 5 a.m.* The zodiacal light very fine, but too many cirri scattered about.

*June the 14th at 7 p.m.* The zodiacal light only faintly visible, although the sky was perfectly clear during the evening.

*June the 17th at 5 p.m.* The zodiacal light visible. The sky was exceedingly bright, and the intensity of the light very great. The upper extremity was near  $\phi$  Ceti, and the Pleiades appeared like a small bright cloud, near the axis of the column of light. The southern edge was very well defined, but the northern one imperfectly so.

|    |     |     |     |     | SOUTHERN.            | NORTHERN LIMITS. |     |        |
|----|-----|-----|-----|-----|----------------------|------------------|-----|--------|
| AR | ... | ... | 10° | ... | $d = - 7^{\circ}.0$  | ...              | ... | — —    |
| "  | ... | ... | 15° | ... | $d = - 5^{\circ}.0$  | ...              | ... | + 3°.  |
| "  | ... | ... | 20° | ... | $d = - 3^{\circ}.0$  | ...              | ... | + 10°. |
| "  | ... | ... | 25° | ... | $d = 0^{\circ}.0$    | ...              | ... | + 15°. |
| "  | ... | ... | 30° | ... | $d = + 4^{\circ}.0$  | ...              | ... | + 22°. |
| "  | ... | ... | 40° | ... | $d = + 11^{\circ}.0$ | ...              | ... | — —    |

*June the 18th at 5 a.m.* The zodiacal light pretty clear.

*June the 30th at 6 p.m.* Traces only of the Zodiacal light visible, although the sky was very clear.

*July the 2nd at 8 p.m.* Sky clear, with a few cirri scattered about; zodiacal light but faintly visible.

*July the 4th at 7 p.m.* The zodiacal light was tolerably bright, but the limits could not be laid down with any degree of certainty. The upper extremity appeared near  $\sigma$  and  $\chi$  Leonis, at 7.10 p.m. Venus was near the base of the column towards the northern edge.

*July the 6th at 7 p.m.* The zodiacal light faintly visible though the sky was rather clear.

*July the 11th at 8.15 p.m.* The zodiacal light distinctly visible, the upper extremity appeared near 22 and 14 Crateri.

*July the 13th at 2.15 a.m.* At this early hour traces of the zodiacal light could be recognised.

*July the 13th at 6.30 p.m.* The sky had an extraordinary appearance. In the W.N.W. horizon rose a narrow stripe of dark clouds, gradually extending over three-fourths of the sky, and forming an angle of 40 degrees, within the milky way; the zodiacal light was clearly visible at the base of this cloud; soon afterwards the sky became quite overcast.

*July the 22nd at 4 a.m.* Beautiful clear night; the zodiacal light visible.

*August the 3rd.* The zodiacal light was exceedingly bright, and its southern edge was defined with great sharpness; notwithstanding a slight haze which overspread the sky, the splendour of the luminous column was so great that a distinct reflection of it was visible in the waters of the swamp. The brilliancy of Venus, situated near the northern edge of the phenomenon, interfered greatly with the exact determination of its limits.

The following table gives the results of observations made at 6.50 p.m.

| AR | ... | ... | 203° | ... | ... | SOUTHERN EDGE.      | ... | ... | NORTHERN EDGE. |
|----|-----|-----|------|-----|-----|---------------------|-----|-----|----------------|
| "  | ... | ... | 200° | ... | ... | $d = -10^{\circ}.5$ | ... | ... | — —            |
| "  | ... | ... | 195° | ... | ... | $d = -14^{\circ}$   | ... | ... | — 5°.0         |
| "  | ... | ... | 190° | ... | ... | $d = -15^{\circ}.0$ | ... | ... | — 4°.0         |
| "  | ... | ... | 185° | ... | ... | $d = -15^{\circ}.0$ | ... | ... | — 2°.0         |
| "  | ... | ... | 180° | ... | ... | $d = -15^{\circ}.0$ | ... | ... | + 2°.0         |
| "  | ... | ... | 175° | ... | ... | $d = -16^{\circ}.0$ | ... | ... | + 8°.0         |

The upper extremity was near Spica in AR 203°. The zodiacal light could still be seen at 9.15 p.m. in the shape of a bow.

*August the 4th at 8 p.m.* The zodiacal light distinctly visible with the exception of the upper extremity. Soon after sunset the western sky became covered with streaks, all radiating from the sun's position. These were probably caused by fog, and were visible at the same place, when the zodiacal light appeared after dark.

*August the 5th.* The zodiacal light visible.

*August the 28th.* The zodiacal light visible, but the sky was too dull to admit of observation.

*August the 31st.* The zodiacal light very intense, but not well defined.

*September the 1st at 9 p.m.* The zodiacal light visible.

*September the 4th at 7 p.m.* The zodiacal light very intense, but the limits could not be ascertained with certainty, as the sky was not quite clear.

*September the 5th.* In the evening as above, and also on *September the 8th.*

*September the 9th.* The zodiacal light visible throughout the whole evening.

*October the 4th at 8 p.m.* The zodiacal light visible but not very bright.

*October the 6th at 8 p.m.* The zodiacal light moderately intense. Throughout the greater part of October the zodiacal light was visible in the evening and was more or less intense. The brightness of Venus interfered greatly with tracing the limits of the phenomenon: between the 2nd and 6th however some observations were made, the results of which are as follow:—

On the 3rd of October the upper extremity was near a point a few degrees towards the south of Venus.

| AR | ... | ... | 240° | ... | ... | SOUTHERN EDGE.    | ... | ... | NORTHERN EDGE. |
|----|-----|-----|------|-----|-----|-------------------|-----|-----|----------------|
| "  | ... | ... | 230° | ... | ... | $d = -22^{\circ}$ | ... | ... | — —            |
| "  | ... | ... | 225° | ... | ... | $d = -23^{\circ}$ | ... | ... | — 20°          |
| "  | ... | ... | 220° | ... | ... | $d = -24^{\circ}$ | ... | ... | — 18°          |
| "  | ... | ... | 215° | ... | ... | $d = -26^{\circ}$ | ... | ... | — 13°          |
| "  | ... | ... | 210° | ... | ... | $d = -28^{\circ}$ | ... | ... | — —            |
| "  | ... | ... | 210° | ... | ... | $d = -30^{\circ}$ | ... | ... | — —            |

As a rule, the northern edge of the zodiacal light was never well defined, while the southern one could always be traced with much greater certainty.

During the whole period between the last of October and the first of March, 1859, no observations have been made on the intensity and position of the zodiacal light, the circumstances being rather unfavorable.

OBSERVATIONS OF MR. WILLS, THREE MILES S.W. OF KOYOORA,—LAT. 36° 40' S. LONG. 143° 35' E.

March 26, at 7h. 32m. p.m.—Very bright meteor, with a train of light. The tail of light remained in the sky about fifteen seconds, and gradually faded away. White light as bright as Jupiter. Course in a line from Canopus to Spica. The commencement was about 20° above Spica, and ended two or three degrees below it. The same meteor was observed at Ballarat, passing from Regulus towards the western horizon, and also at Dunolly, about seven deg. to the westward of Spica (not very reliable though).

March 9, 10h. 44m. p.m. (time might be erroneously noted).—A meteor of the first magnitude, with a train of light. Course from the zenith, passing a few minutes west of Regulus, nearly in the plane of the meridian, through an arc of 65°, in an altitude of 25°. Section 4, parish of Kingower. Lat. 36° 42' S. Long. 143° 40' E.—W. J. W.

March 4, 10h. 24m. p.m.—A meteor of 3rd magnitude. Course from 48 Monocer to ε Gemini, passing fifteen minutes east of Procyon. Observed at sec. 4, parish of Kingower.—W. J. W.

March 15, 7h. 30m. (at same place of observation).—A meteor of 2nd magnitude, with train of light. Course from near 95 and 96 Leonis, passing by Regulus to 14 Leonis.

## OF METEORS.

MARCH, 1858, TO THE 1ST MARCH, 1859.

March 15, 10h. 45m. p.m.—Small meteor from  $\mu$  Hydræ to  $\alpha^2$  Cancri. This is the same meteor as No. 23 in the catalogue, and its more definite positions here were:— $\delta$   $\mu$  Hydræ =  $16^\circ 0'$  S.  $\alpha$   $\mu$  Hydræ 10h. 17m.  $\delta$   $\alpha^2$  Cancri =  $12^\circ 40'$  N., and  $\alpha$ ,  $\alpha^2$  Cancri = 8h. 50m.

On the 20th March, 7h. 45m., a brilliant meteor was seen at Heathcote; it was of the first magnitude, and moved perpendicularly towards the horizon in S.E.

April 12 (observed by Mr. W. J. W., at St. Arnaud).—Observed a meteor of third magnitude passing from  $\alpha$  Trianguli Australis nearly across the South pole, and ending about two degrees above the larger Magellan cloud, and saw four other small ones within the same half hour—one pursuing the same course as the above, two at right angles, and the other at  $45^\circ$  nearly. Lat.  $36^\circ 37' 56''$  S.; Long.  $143^\circ 26'$  E.

April 13 (at same place, and same observer).—A bright meteor of first magnitude, visible four seconds through an arc of  $20^\circ$  to  $25^\circ$ . It commenced at a point between Achernar and the small Magellan cloud, curved slightly towards the West, and became extinct between  $\delta$  and  $\gamma$  Phœnix.

On the 26th March, 9h. 3m., a beautiful meteor fell at Heathcote.

## REGISTER OF METEORS—continued.

NOTE.—No. 122.—A magnificent meteor. Although the size is given above as that of Mars it was considerably larger. At its appearance it was small, but increased as it approached the horizon, and was enveloped in a bright green lustre, at a height of  $35^\circ$ . It moved rather slowly, almost through the prime vertical. It was even observable when it moved behind the clouds. It disappeared without audible noise or sound. This meteor was also seen at Geelong, where the blaze of its light appeared fully equal to that of a full moon on the clearest night. It gave for about three-quarters of a minute (?) a most magnificent illumination to the sky, and lasted altogether about a minute and a half (?). Its body appeared when first seen with a sort of halo of light around it. Its brilliancy gradually decreased, and was soon extinguished. Its direction appeared to be from a point near the zenith towards the western horizon, and just before it was lost sight of it seemed to break in two

pieces. This meteor was also observed by Mr. Ludwig Becker while going down Collins-street, and who describes it as follows:—"It appeared in due W., nearly at the altitude of the Southern Cross, and about two breadths of the Milky Way distant from it to the north. Its color was bluish white. It fell nearly vertical, a little inclined to the south,—duration more than three seconds—disappeared behind a bank of clouds about 30° above the horizon. It left behind but a few rapidly disappearing sparks of a whitish color. Objects in the street showed well defined shadows." It was also seen at Sandhurst towards south, in an altitude of 15°, when it appeared to be of a construction resembling a double star.

No. 168.—Description of this Meteor, as given by the *Argus*:—A brilliant Meteor fell in the southern part of the heavens, about a quarter to ten o'clock. Just before the moment of its extinction it expanded into a broad blue flame, discharging several spheres of fire, intensely yellow in color, and disseminating a transitory flash of light, in comparison with which the lustre of the full moon appeared dim.

| Jupiter  | { Orange purple<br>and violet in<br>the tail. | { 45°   | Course     | 5.0       | 6.0   | { No. 161. At the time that this meteor was exactly westerly to the observer its zenith distance was about 20°—24°. It was extinct after 5 seconds and only the tail was visible, distinctly pale green. The azimuth given refers to the disappearance of the tail, the nucleus disappeared about 10° higher. It was already so bright morning that Jupiter appeared but feebly. Appearance of this meteor, sudden; its motion very regular. It was calm, but no sound was audible or anything remarkable observed. |

October 31, 6h. 45m. p.m., at Ballarat.—A fine meteor observed by Mr. W. W. Wills half way between the comet and Venus, passing westward in a line parallel with the comet and Antares, and ending opposite the latter star. (Position of comet, 17h. 55m. R.A.,  $40^{\circ} 1'$  S. declination.) It left a streak of light behind it like a sky-rocket.

November 11, between 12h. and 1h. a.m.—Five meteors in the neighbourhood of the Southern Cross were observed by Mr. Ludwig Becker—three very small and of short courses, and two of longer duration and more brilliant nucleus.

## REGISTER OF METEORS—continued.

November 14, 7h. 24m., also seen by Mr. L. Becker.—Appeared near Nebula Major, disappeared circa 12 deg. above horizon, and fell vertical. Light equal to Venus; color, white; duration, 3 sec.; had no tail. No sound observed.

No. 203.—Whilst it was still so light, that Canopus could only just be seen, a bright meteor moved slowly in a vertical line in S.E. by S. In the commencement it was hardly larger than Canopus; but when it burst—which resulted in the falling of a great number of slowly detached sparks—it appeared to be double the size of Jupiter. The light was intense white. No sound audible.

| { Brighter<br>than<br>Venus }   | Dazzling white  | 5       | Course     | 1.0       | 0.75  | { Very beautiful meteor. The nucleus increased in size quickly, and had the appearance of a round disc at last, and then disappeared suddenly like a flash of lightning, and without any sparks. The tail only commenced when the meteor had traversed half its course, and increased rapidly in length and breadth. The nucleus had left the tail when it disappeared, and the tail shone vividly after the extinction of the nucleus, and for a very short time. The morning dawn was pretty well advanced at the time of this meteor. |

"No. 298.—A meteor of great lustre, apparently as if Jupiter traversed the firmament almost parallel to the horizon. Moved from S. to W. Disappeared without sound, about 6 degrees above the horizon. The course appeared to be 14 to 16 degrees long."

February 28.—There were five observers during the evening hours.

THE YEAR ENDING 1<sup>ST</sup> MARCH, 1859.

[illegible]

## UPPER CURRENTS OF AIR.

95. There is hardly anything of more importance for the completion of the geographical system of winds in general, and for meteorological science in this country in particular, than the Currents which prevail in the upper regions of our atmosphere under certain circumstances. The theory of winds will soon become established to the greatest nicety, when careful and reliable observations of this nature have been recorded in different parts of the world. It is the more required that the fullest attention should be paid to this matter, as the number of observations hitherto made is comparatively small, and it is therefore considered desirable to publish the observations made thereon in full, in order to enable men, interested in this particular branch of science, to draw the full advantage of the same.

96. By extracting from the registers of the Observatory a complete account of the Upper Currents in the atmosphere, no registration has been used in which the Upper Current corresponded with the prevailing wind on the surface. Whenever the Upper Current differed from that on the surface, it was entered in the register along with the Force of Wind, Form of Clouds, and the exact time the observation was taken. In case a second Upper Current could be observed it was noted, and is to be found in the column for remarks. The direction given is to be understood with reference to the point of the compass towards which the corresponding clouds were drifting.

98. The foregoing table contains the results of observations and measurements of the electric tension made with Quetelet's electrometer. The greatest care was taken in determining the quality of electricity, to prevent any mistake occurring. Whenever the tension of our atmospheric electricity was too great to admit of measurement the sign "∞" was put down, and it may be mentioned here that in most cases of this nature vivid sparks could be obtained from the electrometer.

In the columns headed "Rain" and "Dust" appear the letters B and D respectively, whenever rain was falling or dust floating in the air during the time of exposure of the instrument. With respect to the latter it may be understood, that whenever use is made of the letter D, the neighborhood of the Observatory was enveloped in dust, as is frequently the case during hot winds.

### XIII.—GENERAL REPORT ON THE METEOROLOGY OF THE COLONY OF VICTORIA.

99. When, in the month of March last, the Meteorological Observatory, hitherto in operation at the Crown Lands Offices, ceased to exist, and to me were entrusted the labors of that institution, in addition to my own at the Magnetic Observatory, I formed at once the resolution of carrying into effect an extended system of five-day means.

This is not the place to discuss the high importance of such a system, or its influence on the advancement of meteorology; or to argue that it is almost the only means sure to lead to results which will give us a clue towards the formation of tenable theories, on the leading questions in this science. I will only state that after mature consideration I determined to extend the organization of five-day means to all the country observatories; and further, I undertook the task of applying that system retrospectively to the observations made at the different meteorological stations, during the twelve months, from March, 1858, to March, 1859, before the latter were placed under my direction.

The meteorological journals kept in accordance with the regulations issued by the late director of meteorological observations had no reference to the system above referred to, and required in consequence a thorough examination and reduction for this purpose.

100. On receiving the meteorological registers of the various stations in the month of June last, I found the reductions carried out only as far as they were required for the method of comparison then in use, and consequently, the single readings had to be grouped into periods of five days, the means to be taken, and the corrections to be applied. It is hardly necessary to state, that an immense amount of labor was required to do justice to so difficult a task. But a glance at the tables thus compiled, will show the great advantage of this method of comparing meteorological facts over any other, and will certainly illustrate the value of the work accomplished.

101. The different stations which have supplied observations included in this report, together with the names of those gentlemen who kindly undertook them, are given in the following table:—

| NAME OF THE STATION. |                       |     |     | HEIGHT ABOVE<br>THE SEA. | OBSERVERS.                                                                         |
|----------------------|-----------------------|-----|-----|--------------------------|------------------------------------------------------------------------------------|

| 16                   | Yan Yean              | ... | ... | ...                      | Ch. Taylor, Esq., Engineer.                                                        |

102. The principles, according to which the reductions have been carried out, are the same with reference to the country stations, as have been stated when speaking of the reductions applied to the observations made at the Flagstaff Observatory, and do not require any further explanation here.

103. With regard to the calculations of the means I have to add a few words only. First it must be stated, that the registrations have been made at the following times in all the country observatories, viz. :—

At 9<sup>h</sup>. 30<sup>m</sup>. a.m.; 3<sup>h</sup>. 30<sup>m</sup>. p.m.; 9<sup>h</sup>. 30<sup>m</sup>. p.m.

Besides the direct observations on temperature taken at the above named hours, maximum and minimum self-registering thermometers, have been at the disposal of the several observers; and to arrive at the mean temperature of the day, the extremes recorded by these instruments have been taken in conjunction with the readings at 9<sup>h</sup>. 30<sup>m</sup>. a.m. and at 9<sup>h</sup>. 30<sup>m</sup>. p.m., by which the mean value for the five days has been brought as near truth as is required.

The mean temperature of evaporation was ascertained in a similar manner, and from these *data* the relative humidity has been calculated according to the principles laid down in the introduction to the meteorological part of this report.

104. The mean pressure of air for five days was obtained by taking the means of all registrations made at the above stated hours; it is evident that the value obtained must be somewhat too high; however, this inaccuracy was neglected as the excess will probably be always within the limits of the correction of the instruments, and can never seriously interfere with the object in view.

105. The first series of tables contains the five-day means in Temperature of Air, Pressure of Air, Relative Humidity, Amount of Cloud, and Amount of Rain for their respective five days.

Only those of the meteorological stations appear in these tables which have made a complete set of observations, and these have been classified according to their heights above the level of the sea, commencing with the lowest elevation.

Six periods form a month with the exception of June, which contains seven periods as stated in the "Introduction."

106. The figures given in the columns for Melbourne represent the means of hourly observations, as taken at the Flagstaff Observatory, and consequently are derived from one hundred and twenty single readings.

## 107, 108. FIVE-DAY MEANS FOR THE MONTHS OF MARCH AND APRIL, 1858.

| STATIONS.           |                 | MARCH.     |             |              |              |             |              | APRIL.     |             |              |              |              |              |

# XIV.—METEOROLOGICAL SUMMARIES FOR EACH MONTH.

## 119. REGISTER.

The succeeding tables contain the following data :—

Mean temperature of air, which has been derived from the total number of observations, independently of the five-day means.

The maxima in temperature of air, in two columns, the one containing the date given in days and decimals of a day, and the other the value.

The minimum in temperature of air, in the same manner as above.

Mean pressure of air, derived from five-day means.

Maximum pressure of air, as above, in two columns, one containing the dates of observations, and the other the values.

Minimum pressure of air, as above.

The mean pressure of vapor for the month has been computed from the mean values of pressure of air, temperatures of air and evaporation.

Amount of rain for the month.

Number of days during which the wind blew from the eight cardinal points of the compass.

Remarks and notes, including anything worthy of notice, secondary maxima and minima, and several stations which did not furnish registers sufficiently complete to use the same for five-days means.

| October ...   | 4.97       | 3.85        | 2.47         | 5.70        | 5.45     | 4.32       | 5.73       | 5.60      | 5.23         | 3.05       |
| November ...  | 5.40       | 4.00        | 2.63         | 6.23        | 5.57     | 4.07       | 5.75       | 5.50      | 5.29         | 3.30       |
| December ...  | 4.78       | 3.78        | 2.47         | 5.27        | 4.90     | 3.65       | 5.07       | 5.03      | 4.87         | 1.62       |
| 1859.         |            |             |              |             |          |            |            |           |              |            |
| January ...   | 5.45       | 4.38        | 2.43         | 6.38        | 6.00     | 4.43       | 6.23       | 6.65      | 5.83         | 2.75       |
| February ...  | 4.22       | 3.07        | 1.42         | 4.82        | 4.45     | 3.00       | 6.08       | 5.18      | 4.75         | ...        |

The yearly mean amount of cloud is consequently :—

|             |   |   |   |   |   |   |      |
|-------------|---|---|---|---|---|---|------|
| Castlemaine | - | - | - | - | - | - | 3.04 |
| Beechworth  | - | - | - | - | - | - | 4.41 |
| Heathcote   | - | - | - | - | - | - | 4.45 |
| Geelong     | - | - | - | - | - | - | 5.42 |
| Ballaarat   | - | - | - | - | - | - | 5.52 |
| Melbourne   | - | - | - | - | - | - | 5.81 |
| Camperdown  | - | - | - | - | - | - | 5.83 |
| Portland    | - | - | - | - | - | - | 5.90 |

139. The observations on Ozone have been carried on at the country stations with Moffat's Ozonometer. The different series will be found somewhat imperfect ; however, I subjoin the results and will only call to mind the fact, that Schönbein's test paper has been used at the Flagstaff Observatory.

## MEAN AMOUNT OF OZONE.

## XVI.—ELECTRICAL PHENOMENA.

## 140. MONTH OF MARCH, 1858.

*Melbourne*.—On the 12th, between 8<sup>h</sup> and 9<sup>h</sup> p.m., lightning was seen towards N.W. On the 13th lightning continued during the morning towards W. On the 14th lightning visible in the evening towards W. On the 25th, at 10<sup>h</sup> p.m., lightning towards E.

*Heathcote*.—On the 12th, at 9<sup>h</sup> 30<sup>m</sup> p.m., frequent flashes of lightning.

*Sandhurst*.—On the 12th, at 9<sup>h</sup> 30<sup>m</sup> p.m., lightning.

*Beechworth*.—On the 1st, lightning. On the 9th, at 3<sup>h</sup> p.m., thunder was heard towards W. On the 11th, at 8<sup>h</sup> a.m., thunder was heard. On the 21st, at 9<sup>h</sup> 30<sup>m</sup> p.m., lightning was seen towards E. On the 26th at 4<sup>h</sup> p.m. thunderstorm towards W. and S.W.

*Ballaarat*.—On the 12th, at 10<sup>h</sup> p.m. lightning towards N.W.

*Castlemaine*.—On the 12th, lightning was seen during both day and night.

*Camperdown*.—A thunderstorm occurred on the 12th and 13th.

*Kooyoorra*.—A thunderstorm on the 11th. On the 24th, at 5<sup>h</sup> a.m., a thunderstorm.

*Mount Egerton*.—On the 12th, lightning visible towards W.

*Ararat Plains*.—On the 12th, a thunderstorm. On the 24th, a thunderstorm.

*Mount Ararat*.—On the 12th, a thunderstorm. On the 13th, a thunderstorm.

*Welshpool*.—On the 11th, a thunderstorm.

*Tyntindyer*.—A thunderstorm on the 23rd.

## 141. MONTH OF APRIL, 1858.

*Melbourne*.—On the 3rd, at 8<sup>h</sup> p.m., lightning seen towards N. On the 11th, at 10<sup>h</sup> p.m., lightning. On the 22nd, at 3<sup>h</sup> p.m., a single clap of thunder, and lightning all the evening towards E. On the 27th, between 6<sup>h</sup> 30<sup>m</sup> and 10<sup>h</sup> p.m., lightning was seen towards N.W. On the 28th, at 7<sup>h</sup> and 8<sup>h</sup> p.m., lightning towards S.

NOTE.—As the systematically registered observations on atmospheric electricity were only commenced on the 15th of this month, a summary of the extraordinary disturbances in this meteorological element can only be given for its latter portion.

On the morning of the 15th the electrical tension continued positive until 8<sup>h</sup> a.m. when a sudden change took place and it became strongly negative, registering 10·45; this state continued until 3<sup>h</sup> p.m., a strong breeze from N., which brought with it clouds of dust, blowing all the time, after which the tension changed to positive again. On the 22nd, 28th, 29th, and 30th, the electrical tension was very slight, the electrometer frequently registering 0.

*Portland*.—On the evening of the 27th, lightning towards N.N.E.

*Beechworth*.—On the 23rd, at 4<sup>h</sup> p.m., thunder towards S.W. by S. On the 24th thunder was heard towards N. and N.W.

*Ballaarat.*—On the 11th, at 3<sup>h</sup> 45<sup>m</sup>. p.m., thunder towards N.W. On the 22nd, at 7<sup>h</sup>. p.m., lightning seen towards N.N.W.

*Castlemaine.*—On the afternoon of the 28th, a thunderstorm.

*Camperdown.*—On the 27th, a thunderstorm towards S.

*Ararat.*—On the afternoon of the 27th and of the 28th, a thunderstorm.

*Mount Ararat.*—On the 15th, at 2<sup>h</sup>. p.m., a thunderstorm. On the 27th, at 4<sup>h</sup>. p.m., a thunderstorm. On the afternoon of the 28th, a thunderstorm.

#### 142. MONTH OF MAY, 1858.

*Melbourne.*—The positive electrical tension was remarkably slight on the 4th, 8th, and 14th, and somewhat higher, though still low, on the 3rd, 13th, and 28th. The negative electricity was high during a gale of wind, accompanied with masses of dust, which blew from the N., on the 6th. On the 6th, at 3<sup>h</sup>. p.m., flashes of lightning, with thunder, were observed; the lightning continued throughout the evening towards N.N.E. On the 16th, lightning during the whole evening towards W.S.W. and N.W. On the evening of the 17th, frequent flashes of lightning towards S.S.W. and S.E., their direction gradually moving towards E.

*Heathcote.*—On the 7th, from 2<sup>h</sup> 30<sup>m</sup>. to 3<sup>h</sup> 30<sup>m</sup>. p.m., thunder and lightning, accompanying a heavy squall. On the 17th, at 9<sup>h</sup> 30<sup>m</sup>. p.m., sheet lightning.

*Portland.*—On the 16th, thunder and lightning throughout the afternoon and evening.

*Sandhurst.*—On the 6th, between 1<sup>h</sup>. and 2<sup>h</sup>. p.m., a thunderstorm. On the 16th, at 5<sup>h</sup>. p.m., distant thunder. On the 17th, at 9<sup>h</sup> 30<sup>m</sup>. p.m., sheet lightning towards E.

*Beechworth.*—On the 6th, at 5<sup>h</sup> 30<sup>m</sup>. p.m., a thunderstorm and heavy fall of rain. On the 16th, at 8<sup>h</sup> 30<sup>m</sup>. p.m., a thunderstorm.

*Camperdown.*—On the 5th, at 9<sup>h</sup> 30<sup>m</sup>. p.m., lightning seen towards W. On the evening of the 16th, lightning towards W.

*Ararat.*—On the 6th, a thunderstorm. On the 16th, a thunderstorm. On the evening of the 17th, lightning seen towards E.

*Mount Ararat.*—On the 7th, a thunderstorm at midnight. On the 16th, a thunderstorm in the afternoon.

*Welshpool.*—On the 16th, at 9<sup>h</sup> 30<sup>m</sup>. p.m., forked lightning.

*Swan Hill.*—On the 31st, a thunderstorm.

#### 143. MONTH OF JUNE, 1858.

*Melbourne.*—On the 7th of this month the positive electrical tension was exceedingly small, and remained so, with slight undulations, until the 12th, when it increased, and became comparatively high. On the 27th another minimum occurred, while the greatest positive tension was indicated by the observations made on the 23rd. During the entire month no lightning was seen, nor was thunder or lightning reported from any part of the country.

## 144. MONTH OF JULY, 1858.

*Melbourne.*—The positive electrical tension was very high at the commencement of the month, but it gradually decreased towards the middle, and reached its minimum value on the 14th. The frequent and sudden changes from a high to a comparatively low state of tension were among the remarkable phenomena of the month. Throughout the evening of the 11th, lightning was seen first in S., then in S.E., E. by S., and at 11<sup>h</sup> p.m. in E. On the 12th, the discharge of electric fluid above mentioned continued until 2<sup>h</sup> a.m. On the 14th, at 9<sup>h</sup> p.m., lightning towards W.

*Geelong.*—Lightning was seen on the 14th and 15th.

*Heathcote.*—On the 11th, lightning.

*Portland.*—Lightning was seen on the 14th and 15th.

*Camperdown.*—On the 14th, lightning was seen in the evening.

*Port Albert.*—A thunderstorm occurred on the 11th.

## 145. MONTH OF AUGUST, 1858.

*Melbourne.*—In this, as in the preceding month, the positive tension was high at its commencement, decreasing gradually towards the 10th, from which date the registrations continued low until the 15th and 16th. During the latter part of the month the daily means were subjected to undulations, showing minima on the 19th, 20th, 21st, and 23rd, and maxima on the 4th, 25th, and 26th. On the 24th, at 1<sup>h</sup> 53<sup>m</sup> p.m., distant thunder and lightning towards N.N.E.; lightning continued throughout the evening, first towards S. by E., then S.S.E. and S.E. At 9<sup>h</sup> 15<sup>m</sup> p.m. a reddish flash of lightning, of a globular form, was seen towards S. by E., and at 9<sup>h</sup> 45<sup>m</sup> a similar one in S.E. by S. On the 27th frequent flashes of lightning were seen during the evening, chiefly towards S.W. At 8<sup>h</sup> 15<sup>m</sup> p.m. a reddish globe-shaped flash was seen near the horizon, towards W. At 11<sup>h</sup> p.m. the sky became very dark, and at midnight one appalling clap of thunder was heard, causing the windows to rattle; it was accompanied with rain in heavy drops. On the morning of the 28th, at 6<sup>h</sup>, lightning was seen towards S. by E.

*Geelong.*—On the morning of the 28th, at 12<sup>h</sup> 15<sup>m</sup>, a very violent clap of thunder was heard, preceded by a splendid flash of lightning.

*Beechworth.*—On the 19th, at 3<sup>h</sup> 30<sup>m</sup> p.m., a thunderstorm. On the 24th, at 3<sup>h</sup> 45<sup>m</sup> p.m., a thunderstorm.

*Camperdown.*—On the 1st, a thunderstorm occurred. On the 24th, a thunderstorm.

*Port Albert.*—On the 29th, a thunderstorm.

It is a circumstance worthy of being placed on record, that the peculiar description of lightning above referred to (globe lightning) was observed in various parts of the country, and of the Indian Ocean, during the month of August and the first part of September, as will be seen from the subjoined extracts from ships' logs:—

The Prussian ship *Johanna Wagener* was struck by lightning at 4<sup>h</sup> 20<sup>m</sup> a.m., in long. 111° 31' E., and lat. 39° 29' S. The lightning was seen to descend in a globular form, and was accompanied by a very heavy clap of thunder. As the ship was provided with a lightning conductor it did not receive any material damage.

From the English ship *Conflict* a very bright flash of globe lightning was seen, on September 3rd, in long. 103° E. and lat. 42° S.

“A splendid meteor accompanied with thunder,” which was seen in New South Wales on the 8th of August, at 3<sup>h</sup> p.m., should also be cited here as an additional fact tending to establish the frequency and general distribution, during the periods above referred to, of what M. Arago calls “globe lightning.”

## 146. MONTH OF SEPTEMBER, 1858.

*Melbourne.*—In the period from the 4th to the 16th of this month the positive electrical tension was considerably depressed, as also from the 18th to the 28th; the first and latter days of the month, and the 17th, are characterised as maxima. The smallest mean daily tension fell on the 27th, and the highest on the 17th. The greatest disturbance occurred during a northerly gale on the 21st and 22nd, on which days the electrical tension frequently changed from  $\infty$  negative to positive, and *vice versa*. On the 13th, at midnight, lightning towards E. On the 14th, at 10<sup>h</sup> p.m., lightning towards S.W. On the 19th, at 11<sup>h</sup> p.m., distant thunder. On the 20th, at 10<sup>h</sup> 20<sup>m</sup> p.m., a red flash of lightning close to the horizon (probably globe lightning). On the 22nd, during the evening, lightning was seen in S.S.W. and S.W. On the 24th, in the evening, lightning was seen towards S.E.

*Heathcote.*—On the 19th and 20th, lightning towards E.

*Beechworth.*—On the 9th, a thunderstorm at 6<sup>h</sup> p.m., accompanied by a heavy fall of hail. On the 20th, a thunderstorm. On the 24th, at 2<sup>h</sup> 30<sup>m</sup> p.m., thunder, accompanied by a hailstorm.

*Portland.*—On the 14th, 15th, and 23rd, thunderstorms.

*Camperdown.*—On the 23rd and 24th, thunderstorms.

## 147. MONTH OF OCTOBER, 1858.

*Melbourne.*—The daily means deduced from observations on positive electrical tension were subjected to oscillations of considerable magnitude during this month; the extremes being on the 16th (minimum), and on the 22nd (maximum). On the 8th, 15th, 16th, 17th, 18th and 25th, the electrometer indicated severe disturbances, negative electricity in excess ( $\infty$ ) being frequently registered on the latter day; while on the 30th the total absence of atmospheric electricity was often recorded. On the 8th the electric tension was much disturbed throughout the whole day, and at 1<sup>h</sup> 30<sup>m</sup> p.m. a thunderstorm occurred. Mr. W. Wills (one of the assistants at the Observatory) was in the vicinity of a post in North Melbourne, when it was struck by the last discharge of electric fluid which took place; the post, which extended about eight feet above the ground, was thrown to a considerable height, the lower part of it being burned and shattered to pieces. On examining the hole in the ground from which the post was propelled smoke was found to issue from it, and a sulphurous smell was perceptible. About thirty feet from the spot where this occurrence took place several high buildings and a short iron fence were situated. On the 12th, lightning was seen towards E.

*Heathcote.*—Thunderstorms occurred on the 8th and 25th.

*Sandhurst.*—On the 25th, a thunderstorm.

*Portland.*—Thunderstorms on the 15th and 16th.

*Beechworth.*—On the 15th, lightning was seen.

## 148. MONTH OF NOVEMBER, 1858.

*Melbourne.*—The greatest mean tension occurred on the 13th and 14th, and a secondary maximum in the mean value of atmospheric electricity fell on the 26th, while the minimum mean tension for the month, deduced from the observations made on the 21st, was 1.28. On the 6th, at 8<sup>h</sup> p.m., a thunderstorm passed from W. to E.; some of the flashes were very vivid, and heavy squalls from the N. were accompanied with showers of rain. On the 7th, between midnight and 3<sup>h</sup> a.m., frequent flashes of lightning were observed in the directions S., S.S.E., S.E., and N.E. On the 11th, at 5<sup>h</sup> p.m., distant lightning, accompanied with thunder, is recorded. On the 12th, frequent flashes of lightning were seen in N.N.E. and N.N.W. On the 13th, in the morning, lightning was many

times seen towards S.W., and distant thunder was heard at 7<sup>h</sup>. a.m. On the 16th, during the evening, flashes of lightning were seen towards S.W. On the morning of the 17th a thunderstorm burst over the city. On the 23rd, at 10 p.m., distant thunder was heard towards N.W. On the 29th, thunder was heard throughout the whole afternoon, and at 9<sup>h</sup>. a heavy thunderstorm was recorded. On the 30th, a thunderstorm at 6<sup>h</sup>. p.m.

*Geelong*.—A thunderstorm occurred on the 11th.

*Heathcote*.—Lightning was seen on the 5th, 6th, 11th, 12th, 13th, 17th, 29th, and 30th; and on the 6th, at 2<sup>h</sup>. 30<sup>m</sup>. p.m., a thunderstorm passed over the locality.

*Portland*.—Lightning was seen on the 6th, 16th, and 29th.

*Sandhurst*.—On the 5th and 12th lightning was observed, as also a thunderstorm on the 6th and 29th.

*Beechworth*.—On the 6th, a thunderstorm burst over the township, which lasted nearly the whole of the afternoon.

*Ballaarat*.—A thunderstorm took place on the 6th, and on the 23rd; and lightning was seen on the 29th.

*Castlemaine*.—Thunderstorms were recorded on the 6th, 11th, and 12th.

*Camperdown*.—On the 11th, 17th, and 29th, thunderstorms; lightning also was observed on the 6th.

*Port Albert*.—Thunderstorms on the 6th, 11th, and 17th; and lightning on the 29th.

#### 149. MONTH OF DECEMBER, 1858.

*Melbourne*.—The daily mean values of positive electrical tension were subjected to violent oscillations throughout this month, giving rise to several maxima and minima; the primary maximum fell on the 13th, while the primary minimum took place on the 26th. On the latter occasion the mean value for the day was as low as 0·53. On the 2nd, lightning during the evening. On the 3rd, lightning in the morning, thunder in the afternoon, and in the evening a very remarkable thunderstorm occurred; the discharges, which followed each other with great rapidity, took place in every possible direction, and often appeared to be very near; they were accompanied with very little thunder or rain, not one loud clap was heard. The clouds, which came up rapidly from N.W., continued to emit the most vivid flashes from the time they were first seen on the N. horizon until they disappeared in the S. The thunder was strikingly low, so that it was difficult to connect any single flash with the peal which followed it. At 10<sup>h</sup>. 3<sup>m</sup>. p.m., from 10° to 15° to the W. of the zenith, a discharge of a very peculiar character was observed: it originated in a dark cloud, and the emanation was from one point, towards every direction, the flash assuming for the moment the appearance of a network or star of fine lines 6° or 7° in diameter, of a violet color, as if they were seen through the cloud; no thunderclap followed this display, but at the same moment the flash was seen a distinct noise was heard as if water under great pressure was forced through the air. (The wires of the electric telegraph were 140 feet distant from the place of observation.) On the 4th, the thunderstorm above described continued until 4<sup>h</sup>. a.m. On the 19th, a very heavy thunderstorm was followed by an immense fall of rain and a furious gale from S.W. Lightning was first visible at 2<sup>h</sup>. 18<sup>m</sup>. p.m. The wind blew at first gently from E., at 2<sup>h</sup>. 40<sup>m</sup>. it shifted to W.; at 2<sup>h</sup>. 50<sup>m</sup>. it went back again to E., and came then round by S. very slowly and steadily to N.N.W., its force gradually increasing. The pressure of air was on the decrease until 5<sup>h</sup>. 10<sup>m</sup>. p.m., at which time it attained its minimum of 28·872 inches; after this the wind shifting to S.W. caused the pressure to increase. On the 24th, frequent lightning towards N., at and after midnight; a splendid Aurora Australis was visible simultaneously. On the morning of the 25th, distant thunder was heard. On the 26th, frequent flashes of lightning were visible in the W., at 8<sup>h</sup>. p.m.; at 10<sup>h</sup>. 30<sup>m</sup>. the discharges, accompanied with thunder, approached much nearer, the wind shifting at the same time to N.N.W. and bringing with it heavy showers of rain. The most serious portion of the storm lasted until 11<sup>h</sup>. 15<sup>m</sup>. p.m., during which time the wind gradually changed its direction to W.S.W. On the 27th, thunder and lightning continued during the early morning until daybreak. On the 28th, a thunderstorm passed towards N.E. at 3<sup>h</sup>. a.m.

*Geelong.*—On the 5th, forked lightning was seen.

*Heathcote.*—Thunder and lightning was observed on the 2nd, 3rd, 24th, 25th, and 26th.

*Portland.*—A thunderstorm occurred on the 26th, and lightning was seen on the 2nd and 3rd.

*Sandhurst.*—Lightning was seen on the 2nd, and thunderstorms were recorded on the 3rd, 25th, and 26th.

*Beechworth.*—Heavy thunderstorms on the 15th, 19th, 24th, 25th, and 26th.

*Ballaarat.*—Thunderstorms occurred on the 2nd, 3rd, 11th 12th, and 19th.

*Castlemaine.*—Thunderstorms took place on the 7th and 25th.

*Camperdown.*—Thunderstorms noted on the 2nd, 3rd, 12th, and 26th.

*Port Albert.*—Lightning was seen on the 2nd and 26th, and thunderstorms were registered on the 19th and 25th.

#### 150. MONTH OF JANUARY, 1859.

*Melbourne.*—At the beginning and end of the month, the electrical tension was comparatively high; the maximum of the daily means occurred on the 27th and 28th, and the minimum on the 16th, the former being 4·64, and the latter 0·58. On the 8th, at 3<sup>h</sup> p.m., thunder was heard towards N. On the 9th, at 12<sup>h</sup> 20<sup>m</sup> p.m., thunder was heard towards N.W., and in the evening towards E. On the 16th, in the evening, frequent flashes of lightning were seen towards W. and S.W. On the 17th, during the early morning, lightning was seen and thunder heard towards N.E. On the 22nd, several flashes of lightning towards S.E. by S. On the 23rd, throughout the morning, lightning was in W.S.W. and S. by E., and thunder was heard at 8<sup>h</sup> a.m. On the 24th, lightning during the whole evening, towards N.W. and S. On the 26th, a thunderstorm passed towards N. at noon.

*Heathcote.*—Thunder on the 8th, 9th, and 16th.

*Portland.*—Thunder and lightning on the 24th and 25th. Lightning was seen on the 24th, and a thunderstorm occurred on the 16th, and on the 23rd.

*Sandhurst.*—Thunder was heard on the 7th, 8th, and 16th, and sheet lightning was seen on the 7th, 8th, 9th, 16th, 23rd, and 24th.

*Beechworth.*—Lightning on the 5th. Thunder and lightning on the 7th, 9th, 10th, and 17th.

*Ballaarat.*—Thunderstorms on the 1st, 7th, 9th, 16th, 17th, 22nd, and 28th; and sheet lightning was seen on the 23rd.

*Castlemaine.*—A thunderstorm on the 23rd.

*Camperdown.*—Thunder was heard on the 8th, 9th, 24th, and 25th.

#### 151. MONTH OF FEBRUARY, 1859.

*Melbourne.*—Only a slight positive electrical tension manifested itself during the first part of this month, from the 2nd to the 9th; the mean value then increased, and remained comparatively high for the remainder of the month, although subject to great oscillations. The maximum value in the daily means was obtained on the 22nd, and the minimum on the 3rd; the former amounted to 3·95, and the latter to 0·55. On the 9th, two distant claps of thunder were heard, at 3<sup>h</sup> 35<sup>m</sup> p.m. On the 20th, between 7<sup>h</sup> and 8<sup>h</sup> p.m., lightning was seen towards N.W. On the 21st, at 3<sup>h</sup> a.m., thunder and lightning towards W. and N.

Heathcote.—Thunder and lightning on the 20th.

Ballaarat.—Lightning on the 20th and 21st.

Camperdown.—Thunder was heard on the 21st.

Castlemaine.—Thunder on the 20th.

Port Albert.—Thunder and lightning on the 20th.

Yan Yean.—Thunder on the 20th.

152. The following table contains the mean positive electric tension, calculated for each month ; also, the number of negative and naught registrations made, the number of days on which thunderstorms were recorded, and the number on which lightning only was observed, at the Flagstaff Observatory, Melbourne :—

# NAVIGATION.

---

## I.—INTRODUCTION.

153. One of the first steps taken, when the labors of the Observatory were in a fair state of organization, was an arrangement for advancing the interest of Navigation. The chief points in view being the collection of ships' logs, for the purpose of extracting therefrom facts, which might be made available for developing our theories on the principal meteorological questions and their systematic examination, according to a plan adopted for the advancement of our knowledge on the Currents of the Ocean and Atmosphere; and lastly, the assistance which an observatory might render to masters of ships, by giving an opportunity of having their instruments corrected, and information supplied on the scientific portions of Navigation.

154. How evident soever the advantages of such an institute may be to the advancement of Navigation, the difficulties we had to contend with were by no means insignificant, and it was only after a considerable time that nautical men became aware of the existence of the institution as a depository for scientific information.

I am happy to say that before the close of the first twelve months of the working of the Observatory, the appreciation of its labors for the advancement of Navigation was general, and the single fact that upwards of 250 nautical men of all nations have visited the Observatory within the abovenamed period, is sufficient to prove such an appreciation.

155. With regard to the perusal of the logs, I must state in explanation:—Those logs that are kept according to Maury's principle or on the plan of the Board of Trade, are only extracted, and phenomena worthy of notice are used for the completion of the registers of the Observatory, whilst common logs are thoroughly copied and the results classified according to time and locality. For this purpose a register is kept, in which the facts are entered on the plan proposed and so successfully carried out by Lieutenant Maury, U.S.N., director of the Nautical Observatory of Washington. The number of logs thus registered during the year ending March the 1st, 1859, amounts to sixty-one. But it was not thought advisable to give the results derivable from these labors at present, as it would be of advantage that the observations should extend over a longer period of time; I hope I shall be able in my next yearly report to lay before the nautical public some satisfactory results. For the present I subjoin here some few extracts only, which are calculated to throw some light on the nature of storms and prevailing winds in some parts of the southern hemisphere. Besides these I have given copies of voyages in particularly interesting portions of the ocean, as well as some others that have not been entered in the registers above referred to.

156. A similar plan to that just described has been followed in arranging facts collected on the Australian coast and adjoining seas; but the manner in which these logs were usually kept made it almost impossible to derive reliable facts from them. I therefore resolved to introduce another method of registering nautical and meteorological observations, by means of an abstract log. But the want of good instruments for the purpose has greatly interfered with the entire success. I am happy to say that several gentlemen have been most willing in advancing meteorology, some by keeping a small abstract in accordance with the means at their disposal. From amongst them I take the opportunity to mention the names of two gentlemen here who have forwarded some valuable material for this first nautical report, viz., — Gillfillan, Esq., master of the schooner *Yarra*, and — Pole, Esq., master of the barque *Formosa*.

I hope that the example of these two gentlemen will be followed as soon as the necessary instruments and printed forms can be procured.

157. The observations published in the following extracts and copies have been made with instruments that have been compared with the Melbourne standard, and the corrections have been applied accordingly. Besides these, 117 instruments—Sextants, Barometers, Thermometers, and Chronometers—have been carefully examined, and corrections given; a matter that we must allow can scarcely be over-estimated, when we take into consideration that the value of observations so much depends on the condition of the instruments used. Great attention is paid to providing captains of ships with the errors of eccentricity and division of their sextants; and I would here remark that these two errors interfere more frequently with the value of observations than we should at first sight imagine, so much so that arrangements should be made in every seaport to furnish nautical men with these corrections, which are only to be ascertained, when at sea, with considerable trouble, and are therefore generally neglected, a practice which must greatly interfere with the value of observations on lunar distances.

158. Instruments that are out of order are repaired in the little workshop of the Observatory, and several barometers have been re-boiled and fitted again. All these things are done gratuitously, under the sole condition that the Observatory is to have the use of the respective logs, and that the captains are to keep abstracts, to be delivered up, either to this Observatory or to any other institute of a similar nature.

Many masters of ships have been supplied with ruled forms, and we may soon hope to hear of the use that has been made of them.

159. The following table contains summaries of voyages from Europe to this port, arranged in a manner that will greatly facilitate the comparison of the different routes through the North and South Atlantic and the Indian Ocean. With few exceptions these summaries start from  $49^{\circ}$  north latitude and  $6^{\circ}$  or  $7^{\circ}$  west longitude, and end with the day when the respective ships sighted Cape Otway. At the head of the table are figures showing the number of days that the ship was out, and in the corresponding square we see at once its position—the upper figure being the latitude and the lower the longitude. In order to indicate more distinctly the chief points in this voyage, the days of passing the equator and the meridian of Greenwich are marked by two parallel lines, and the meridian of the Cape by one only.

## II.—FROM EUROPE TO MELBOURNE.

## 160. VOYAGES OF THIRTY-NINE SHIPS.

| NAME OF SHIP.                                                                      |                        | NUMBER OF DAYS OUT. |           |            |            |            |            |            |            |            |            |            |            |            |

<sup>1</sup> And made Cape Otway eight days later.<sup>2</sup> And four days more.<sup>3</sup> And sixteen days more.<sup>4</sup> And four days more.<sup>5</sup> And ten days more.

161. The two following abstracts, kept by Captain Tobin, Commander of the *Ocean Chief*, have been forwarded to the Observatory for perusal. The first comprises a voyage from Sydney to Liverpool, in the year 1855; and the second, one from Liverpool to Melbourne, in 1856. In the column headed "Thermometer," it is to be understood that A signifies the *air*, and W the *water*; in these instances the barometers used have not been compared with the standards:—

ABSTRACT OF A VOYAGE OF THE SHIP *OCEAN CHIEF*, THOMAS JAMES TOBIN  
COMMANDER, FROM SYDNEY TO LIVERPOOL, 1855.

VOYAGE OF THE SHIP *OCEAN CHIEF* FROM LIVERPOOL TO MELBOURNE—continued.[illegible]

163. Captain N. Stoertenbecker, of the Hamburg ship *Cesar Godeffroy*, has kindly furnished me with the following Abstract, on the state of the wind and weather during his passage out here in the year 1857.

The barometer and thermometer have been compared with the Melbourne standards and the corrections applied to the readings.

EXTRACT FROM THE JOURNAL OF THE *CESAR GODEFFROY*, CAPTAIN STOERTENBECKER.  
VOYAGE FROM HAMBURG TO MELBOURNE.

NOTE.—The small figures below the direction of the wind signify the force of wind by Maury's notation. Barometer and thermometer were registered at noon.

164. Although the following abstract contains no registrations of barometer and thermometer, it was thought advisable to have the state of the weather and wind, as given by Capt. Struyke, published in full, as the information on the South Pacific is, as yet, comparatively incomplete, and every report thereon will be received with interest. The direction of the wind is given three times a day, and the times for which the registrations are meant are for the first part, from noon to 8<sup>h</sup>. p.m.; for the second, from 8<sup>h</sup>. p.m. to 4<sup>h</sup>. a.m.; and for the third, from 4<sup>h</sup>. a.m. to noon again.

ABSTRACT OF THE LOG OF THE SHIP *CAROLINA*, CAPTAIN STRUYKE, ROTTERDAM, FROM  
SAN FRANCISCO TO PORT JACKSON, *viâ* HUMBOLDT BAY, 1858.

## III.—MAURITIUS TO MELBOURNE.

165. Captain de Prevoisin kindly furnished me with a copy of a journal kept on a voyage from Mauritius to Melbourne. The barometer and thermometer have been compared in this Observatory, and the corrections applied accordingly. The readings of the former are given in centimetres, and those of the latter in degrees Réaumur.

N.B.—The figures below each wind direction denote the strength of wind, the scale from calms to hurricane being divided into seven divisions; x denotes squally; x x strong squalls; x x x very hard squalls; B denotes rain; and b fine drizzling rain; B strong rain; a denotes hazy weather; and this applies to the other voyages given unless expressly mentioned.

#### IV.—HURRICANES IN THE INDIAN OCEAN.

167. The two following extracts, from the log of the ship *Marion* and from a letter of Captain Stoertenbecker, are very illustrative of the character of Hurricanes in the Indian Ocean, and may well find a place here. With reference to the first I may state that the observations made at this Observatory on the same days gain much interest when compared with this report :—

##### EXTRACT FROM THE LOG OF THE SHIP *MARION*, CAPT. FLEMMING, ON HER PASSAGE FROM MELBOURNE TOWARDS COLOMBO, CEYLON.

DECEMBER 4TH, 1858.—Latitude at noon,  $12^{\circ} 23' S.$ ; Longitude,  $83^{\circ} 46' E.$  At 4 p.m., wind N.E., squally; the wind very variable, and inclining towards E.

DECEMBER 5TH, 1858.—Wind S.E.; much rain at midnight. Afterwards the wind rapidly increasing, with a very threatening appearance, and the barometer falling from 30.00 in. to 29.20 in. (very unreliable observation); temperature  $83^{\circ}$ . Wind frequently shifting, S. to S.W. to N.N.W. to N.E. At 1 a.m. (5 o'clock a.m. Melbourne mean time).—Latitude,  $11^{\circ} 5' S.$ ; Longitude,  $83^{\circ} 55' E.$  The wind veering to S.W. in violent gusts. Called all hands to furl the sails, but before this could be done a terrific hurricane commenced to rage, with thunder and lightning. Topsails carried away, and blowing all other sails out of the gaskets and perfectly clear away from the yards and masts. The lightning struck the maintop-gallant mast, and, running down the wire on the mainroyal stay, carried away both top-gallant masts close by the cap. The ship was now thrown on her beam ends. Two a.m.—The hurricane at its height (Melbourne mean time 6 a.m.), blowing more steadily in its force—the atmosphere being very dense, so much so that the man at the wheel could not discern the compass at the ordinary distances. Three a.m.—It began to clear again in N.E., but the wind remained unabated. The hands standing by to cut away the masts. Four a.m.—Moderating; the hurricane travelling W.S.W. Five a.m.—Steady gale. Six a.m.—Passed several portions of broken masts belonging to a ship.

At noon of the 4th, Latitude  $11^{\circ} 0' S.$ ; Longitude  $83^{\circ} 39' E.$ ; Barometer 29.90 in.; Thermometer  $83^{\circ}$ .

Currents setting S.W.

[*Simultaneous with the above.*]

##### EXTRACT OF THE SHIP *HENRIETTA HELENA*, ON THE 4TH AND 5TH DECEMBER.

Latitude  $32^{\circ} 33' S.$ ; Longitude  $29^{\circ} 43' W.$ ; regular S.E. trades; Barometer 29.83 in., falling, namely :—December 4th, 29.85 in. at noon; 5th, 29.83 in.; 6th, 29.68 in.; 7th, 29.75 in.; 8th, 29.77 in.; 9th, 29.60 in.; 10th, 29.53 in.—Latitude  $36^{\circ} 43' S.$ ; Longitude,  $15^{\circ} 38' W.$

##### EXTRACT FROM A LETTER OF CAPT. STOERTENBECKER (*CESAR GODEFFROY*), FROM BATAVIA, ON A PASSAGE ROUND THE LEEUWIN TO JAVA.

Batavia, 6th July, 1857.

According to promise I have the pleasure to acquaint you of our safe arrival here, after a very disagreeable passage. It is a tedious voyage to pass Cape Leeuwin in this season, as we had continued W.N.W., W., and N.N.W. winds, almost without exception, and only enjoyed W.S.W. and S.W. breezes of very short duration, when in  $19^{\circ} S.$  latitude, which veered in two days to E. and E.N.E. On the 23rd we made the coast of Java, and arrived in the roadstead here on the 27th. The compass oscillated very considerably in that part of the Indian Ocean, where the variation is 0, and particularly during a high sea, taking four points towards each side. Until Cape Leeuwin we had no great storms. The heaviest weather we experienced from  $36^{\circ}$  to  $30^{\circ} S.$  latitude—terrific squalls, with the wind N. and N.N.W., and heavy thunder and lightning. The air appeared sultry, and the weather turned to hurricane-like squalls, with thunder and lightning, when we were obliged to furl the close-reefed foretopsail. This, however, lasted only about one hour and a half, when rain began to fall in torrents, and the wind veered to W. and W.S.W., with squalls. After about twenty hours the wind returned again to N.W., and it remained fine weather till the 20th, when squalls set in again from S.W. According to your instruction, the abstract log is kept with the best of success.

168. I subjoin here a table showing the directions of wind and the pressure of air during a hurricane that occurred on the 1st and 2nd of March, 1859, in the Indian Ocean, and of which accounts have reached through the logs of two ships, *Johannes* and *Magdalena*. The log of the ship *Richard* also illustrates the nature of this phenomenon; and some extracts have been given here, together with the hourly observations on pressure of air and direction of wind, as made in this Observatory during the occurrence.

### HURRICANE IN THE INDIAN OCEAN ON THE 1ST AND 2ND OF MARCH, 1859.

| 1859.                       |                | FLAGSTAFF<br>OBSERVATORY.                                                                                                                                                                             |                                                                                                                            | SHIP <i>JOHANNES</i> , CAPTAIN BRUHN.*<br>(40°59' S., 49°16' E.) |        |            |                              | SHIP <i>MAGDALENA</i> †<br>(23°83' S., 43°41' E.) |        |                                        | SHIP <i>RICHARD</i> .<br>(60°12' E., 38°18' S.) |                                             |

### EXTRACTS FROM THE LOG OF THE SHIP *JOHANNES*, CAPTAIN BRUHN.

SUNDAY, 27TH FEBRUARY.—Noon, partially covered sky, fresh breeze from W. by N.; course E.S.E. per compass, about 8 knots run. 4 p.m., latitude per observation, 41° 12' S.; longitude per chronometer, 44° 40' E.; barometer, 29.55 in.; variation, 27° W., per azimuth, at sunset; wind fresh, few clouds but of very dark color; beautiful sunset; a few dark clouds looking like precursors of rain. Midnight, same wind and weather. After midnight, covered sky, but soon clearing away again; light fleecy clouds passing rapidly. Forenoon, wind lessening, covered sky. Noon, latitude by observation, 40° 59'; longitude per chronometer, 48° 38'.

MONDAY, 28TH FEBRUARY.—Afternoon, light winds from W.N.W. and calm. At 3 p.m. light airs from E.N.E., covered sky; made three knots S.E. run. At sundown, increasing wind. At 8 p.m. took in all light sail and took in a double reef in foretop; course from 8 p.m. to 12 midnight, S.E. by S. Wind increasing and shifting northwards, the air being thick with fine misty rain. After midnight a few stars became visible near the zenith; clouds passing rapidly; the ship run circa 10 knots between 8 p.m. and 8 a.m., course S.E. by E. At sunrise it blew a perfect hurricane from N. and N. by E.; the sun cast a fiery red light over the sea which rose very high and was covered with white foam as far as the eye could reach. From 4 a.m. until 8, contrived with very great pains to take in successively all sail, and put the ship under close-reefed foretopsail. At 8 a.m. were obliged to take in the foretopsail, and to bring the ship to under the lee sheet of the maintopsail only. From 8 a.m. till 10 a.m. the rain poured down in torrents, accompanied by very hard squalls. Towards noon the wind shifted to N.W., with passing showers.

TUESDAY, 2ND MARCH.—Afternoon, hard gale, N.W. to W. by N.; barometer rising. At sunset, decreasing gale. At 11 p.m. weather became more moderate, set the necessary sails and steered E. per compass, and made 7 to 8 knots under double reefed topsail.

## V.—COAST OF AUSTRALIA.

169. The logs copied here have been supplied by Captain Gilfillan, who undertook to keep a meteorological register whilst trading on this coast. The figures given in the columns headed "Barometer" and "Thermometer," represent the means of six observations—taken at noon, 4<sup>h</sup> p.m., 8<sup>h</sup> p.m., midnight, 4<sup>h</sup> a.m., and 8<sup>h</sup> a.m.

Apart from the general interest that must be attached to these carefully made observations of the wind and weather on this coast, they will be found highly valuable when compared with the corresponding observations made at this Observatory; and it certainly confers great credit on Captain Gilfillan that he has so earnestly given his support to meteorological investigations.

170. VOYAGE OF SCHOONER *YARRA*, CAPT. GILFILLAN, FROM MELBOURNE TO ADELAIDE.

## GENERAL REMARKS.

It will be seen that we have had some heavy weather during the passage. The first breeze was when off Cape Otway, which lasted up to midnight of the 9th, when the wind shifted from northward to S. by the west and taking its regular course, after falling light, round the east to the north, being lightest at east. It continued to haul round to S.W. again and fell calm and was lightest when E.N.E., continuing to follow round to west by the north, and blew hardest when between W.N.W. and S.W., from which quarter we experienced some very heavy hail squalls. It continued some time at S.W., then hauled back by the west to north, after which it fell light, and came to N.E. There the breeze increased and hauled round to N.W. by the north and blew hard. It then gradually became calm, again sprung up from N.W. light, fell then calm and in the calm shifted to S.W. light, when we arrived in Adelaide.

171. VOYAGE OF SCHOONER *YARRA* FROM ADELAIDE TO MELBOURNE.

| During this passage we have had very fine weather and light winds principally between North and East, veering and hauling two or three points either way. We have generally had fine clear weather with heavy dews at night, but no rain. The wind at the latter part of the passage hauled round to the westward, when it became squally, cloudy, and threatened rain, and the barometer fell below 30 inches. |                                 |                 |       |          |            |            |           |        |            |                                                                                                                                                                           |

| GENERAL REMARKS.                                                                                                                                                                                                                                                                                                    |                                 |                 |       |                    |            |            |            |        |        |                                                                                                                                                                                                                                                                                                                          |
| At noon, very strong breeze from S.W., with stormy-looking weather, and small rain in smart squalls, and heavy sea running along the land. Made the heads at 4 p.m., passed up through the west channel, and came to an anchor off Point Richards at 10 p.m., the wind having died away gradually till nearly calm. |                                 |                 |       |                    |            |            |            |        |        |                                                                                                                                                                                                                                                                                                                          |

180. The great experience of Capt. D. Pole as a regular trader on this coast renders the following account of a storm which occurred on the 16th of June, 1857, exceedingly valuable, so that I considered myself justified in bringing this interesting document into my nautical report :—

EXTRACT OF A LETTER RECEIVED FROM CAPT. D. POLE, OF THE *FORMOSA*, RELATIVE TO  
SOME GREAT EASTERLY GALES ON THE COAST.

Melbourne, 22nd November, 1858.

I have long wished to forward some information upon the winds and weather of the coast of Australia to some one who might make it of service to the maritime public. I take this opportunity of giving you an account (only from memory) of one of the great easterly gales on the coast of New South Wales in 1857. I was chief mate of the vessel ; she was a large steamer, belonging to the A. S. N. Co. of Sydney, called the *Governor-General*, and had been built in America.

On June 16th, 1857, during the day, in Sydney, the weather was unsettled, raw, and gusty, and I observed the clouds coming with great force from E.S.E. Still there was not much wind during the day, beyond occasional puffs.

At 5 p.m. we cast loose from the wharf, and went to sea—the three Barometers standing within one-tenth or so of each other, about 29.40 in., 29.50 in., 29.65 in. There was little wind when we got outside, but there was a ponderous swell, tumbling right upon the land, and the weather was particularly dirty and threatening. I mentioned also a vivid flash of lightning on the northern board to the captain, but neither he nor I had ever seen the same kind of weather before, although old coasters.

We expected the wind would come out at N.W., in its usual way, veer round to W., and blow itself out in a gale from S.W., by which time, the wind being off the land, we should have been able to have reached Twofold Bay, and there to have taken shelter. Instead of this, at 6.30 p.m., just as we were losing sight of Sydney Light, in the showers, the wind suddenly began to freshen from S.E.—ship's head S. by E., on account of the heavy swell. At 8 p.m. there was a continual drizzle of rain, and round the horizon (eastern) I observed a faint bank of light, just distinguishable from the murkiness overhead. The Barometers had also fallen, but I shall only give the heights of the Mercurial and Aneroid, as I did not observe the Sympiesometer very attentively.

At 8 p.m. the Mercury was 29.42 in., or thereabouts—the Aneroid one-tenth lower ; and from this, for the next twelve hours, it appeared to me that the former glass fell at about the rate of 0.05 in. every four hours, and then began to fall more rapidly till the height of the gale.

At midnight the gale had increased, and was hourly doing so. The wind steady at E.S.E., with very heavy sea ; the ship surging her lee sponsors completely under.

At 3 a.m., June 17th, the chief engineer reported to me that the connecting pipes of one of the boilers had given way, and that he was fearful for the safety of the boilers themselves, from the heavy rolling of the ship. I reported this to Capt. Cottier, and it was determined we should alter our course to S.E. and by E., so as to bring the ship more head to sea. This was done at 4 a.m. At 8 a.m. it was blowing a hard gale from E., and we commenced sending down all masts and yards.

At noon the gale was at its height ; the wind steady at E., ship's head E.S.E., but she fell off greatly into the trough of the sea. Thick rain throughout. The force of the wind gradually abated from this up to midnight.

About 2 a.m., June 18th, I observed the sky to clear overhead, but with thick rolls of clouds all round. At 5 a.m. we bore up and steered W. for the land, and to allow the engines to pump the ship out quicker. We had then about three feet water in the hold. We stood in for the land till noon without making it. At noon we found the latitude by observation to be that of Cape Dromedary, 150 miles from Sydney. The weather was moderate at this time, the wind veering gradually into the S. At this time we determined on returning to Sydney, the ship being utterly disabled, and the Barometers having fallen fast during the day. The Mercury on the afternoon of the 18th was 29.00 in., and the Aneroid 28.90 in. As we expected, the wind burst upon us at 8 p.m. from S.W., and in one of the gusts blowing the main trysail to shreds. We were now steering N.

June 19th.—At 4 a.m. the sky was completely clear, but there was a heavy gale blowing from W. Ship steering W.N.W., to get under the lee of the land. All the forenoon it blew fiercely, but about 9 a.m. the Barometer began to rise.

About noon we had the high land of Kiama in sight, and as we drew in towards it the Mercury rose rapidly, and the wind died away, finishing off in a gentle breeze from W.N.W.

June 20th, 4 a.m., entered Sydney harbor.

I am, Sir, &c.,

D. POLE.

N.B.—There was a great flood in the River Hunter during this gale.

181. With reference to the turning of the wind, the two following extracts, received from Captain Stoertenbecker, deserve the attention of those who are interested in the navigation of this coast.

183. It has been already mentioned, in the Introduction to the Nautical Report, that a part of the labors connected with the perusal of logs consists in classifying occurrences in nature according to Melbourne mean time. As many journals as I have found it possible to obtain have been subjected to examination, and the extracted facts arranged in the manner shown in the subjoined extract. The leading principles which guided me in the arrangement of simultaneous occurrences are simply as follows : Every serious disturbance indicated by the meteorological instruments at Melbourne was investigated by opening a register in which were entered, in separate columns, four registrations of the different instruments, made at midnight, 6 a.m., noon, and 6 p.m., on the day on which such a disturbance took place ; uniformly with these entries, and in the same columns, all attainable simultaneous readings and phenomena recorded at other places were entered. Any occurrence worthy of notice found to have taken place on board ship or elsewhere was treated in a similar manner.

I have subjoined here such a comparison of events for August, 1858, to illustrate this method of investigation by an example, and I hope to be able to give in my next yearly report a complete series of these registers, the great value of which, for the advancement of our theory on winds and other phenomena, is self-evident, and requires no recommendation.

I selected the 10th, 12th, 21st, and 30th of August, on which days the barometer stood very low at the Melbourne Observatory, and by examining the state of the instruments in other stations, we find facts which, by a greater number of observations and after a longer period of meteorological research, must lead to splendid results.

## EXTRACT FROM THE REGISTER OF SIMULTANEOUS

MELBOURNE

184. Captain A. H. Kiehl had the kindness to forward to the Observatory his abstract log for examination, accompanied by the following letter, drawing my particular attention to certain phenomena. The interest attached to this matter is increased by comparison with the simultaneous register given in the foregoing paragraph, and with the monthly abstract of the Flagstaff Observatory.

EXTRACT OF A LETTER FROM THE MASTER OF THE SHIP *HEBE*, ROTTERDAM, REPRINTED  
FROM THE "*SYDNEY MORNING HERALD*."

Left Hong Kong on the 28th of June, in company with the French ship *St. Paul*, bound for Sydney and Melbourne; spoke her and resolved to take the eastern passage. Having reached eight degrees latitude north, were compelled to take the Gilolo and Pitt's passage, by reason of adverse winds. Had fine weather all the way. On the 21st of August a heavy head swell was experienced, which increased as the ship proceeded southward. We were then in latitude  $19^{\circ}$  S., longitude  $110^{\circ}$  E., and saw a Cape hen in this latitude, which surprised me. On the 22nd, in latitude  $19^{\circ} 30'$ , longitude  $108^{\circ}$  E., the wind, although lightly, began to blow in gusts, and the barometers ascended, the swell increasing still. On the 23rd, in latitude  $20^{\circ} 30'$  S., longitude  $105^{\circ} 20'$  E., saw Cape pigeons and flying fishes at the same time, which I had never seen before during thirteen years. On the 25th, in latitude  $23^{\circ}$  S., longitude  $103^{\circ} 25'$  E., the barometer descended from 30.35 to 30.15; wind shifting to S.W., blowing in gusts with moderate breezes; the seas now running very high, and with great rapidity, from S.S.W. and S. At 9 P.M., strong squalls from S.W.; feeling pretty certain that a cyclone was raging near, double reefed topsails; standing to seaward; weather grew worse; sky overcast and threatening; close reefed topsails and reefed courses, although not blowing strong at the time. Sea very heavy from S.S.W. On the 26th, barometer at a stand; and fearing to run into bad weather over this tack, wore ship to westward, to run out of the heavy seas, and to get a favorable wind the sooner; let out reefs, and soon found ourselves in fine weather again. On the 27th, when the weather changed its appearance, and wind set in from S.E., again, at midnight, being in latitude S.  $24^{\circ} 30'$ , and longitude E.  $105^{\circ} 30'$ , I concluded that there had been a cyclone passing in a N.N.E. direction (true), which will have created northerly gales on the coast of Australia. When in latitude  $31^{\circ} 45'$  S., longitude  $103^{\circ} 50'$  E., on the 2nd of September, a gale set in from the N.N.W. going round to W. and S.W. On the 3rd, barometer 29.64. Wind backing again into N.W. on the 5th, and blowing up heavy, increasing to a furious gale at midnight. Between the 6th and 7th of September, force of wind 10, of squalls 11. Barometer lowest at 0h. 15m. A.M., 29.48; wind hauling W., backing into N.W. again on the 8th, when in  $40^{\circ} 42'$  S. latitude, and  $123^{\circ} 2'$  E. longitude. On the 9th, at 7 P.M., barometer again down to 29.47; hauling S.W. in a tremendous squall, blowing up with great force from S.W. and S. until the 11th, in latitude  $40^{\circ}$  S., and longitude  $134^{\circ} 40'$  E. On the 13th, in latitude  $40^{\circ}$  S., longitude  $140^{\circ}$  E., a gale from N.E. set in; barometer falling from 30.22, on the 11th and 12th, to 29.16. On the 14th, wind hauling N.; at midnight, between the 13th and 14th, force of wind 10. On the 14th, at 6 A.M., barometer lowest, slowly rising; wind W.N.W., with tremendous squalls, for which we were obliged to furl mizentopsails, having closereefed maintopsail, and reefed foresail set, expected them to burst every minute. At 4 A.M., on the 15th, sighted Cape Otway lights; kept her off (E. Mag.). Through Bass's Straits, seas very high. Midnight, between 15th and 16th, passed Deal Island; had the most furious hurricane gust when passing there; wind W.S.W., force from 9 to 11, with a dangerous sea; barometer risen up to 29.70. At noon, on the 17th of September, in latitude  $38^{\circ} 8'$ , longitude  $151^{\circ} 17'$ , barometer 30.33, with good weather, wind S.W., yet very heavy seas.

A. H. KIEHL.

185. The great interest attached to the passage through Torres Straits will make the following abstract, and brief account of a voyage in this part of the ocean, a valuable document, especially as it has been drawn up by so intelligent a naval officer as M. de Prevoisin. The same remark, with regard to the instruments used, as was made in the previous document, applies here also.

JOURNAL DU NAVIRE FRANÇAIS *FREHEL*, CAPITAINE TH. DE PREVOISIN, PENDANT LE  
VOYAGE DE MELBOURNE À SINGAPORE VIA TORRES STRAITS, L'AN DE 1858.

## 186. LETTER FROM CAPTAIN PREVOISIN, ACCOMPANYING THE PRECEDING OBSERVATIONS.

J'ai l'honneur de vous adresser, comme je vous l'ai promis, un extrait de mon journal de mer concernant ma dernière traversée de Melbourne à Singapour.

J'y joins quelques observations qui me paraissent utiles.

J'ai passé Port Phillip Heads le 4 Juin. Le 4, 5, 6, et 7, dans le détroit de Bass, j'ai éprouvé de vent fort du N.E. à l'E.N.E., temps clair. Le 7 j'ai passé Banks's Strait avec du vent de N.O., temps couvert et plaisant. Le 8, 9, et 10, coup de vent qui d'abord commence au N.O., descend à l'ouest, avec accompagnement de grains violents et fréquents, et finit au S.S.O., jolie brise. Les vents alisés de S.E. m'ont pris entre le 26 et 27 deg. de lat. S. Le 14, 15, et 16 Juin, j'ai eu le vent de la partie du N.E., temps couvert et pluvieux à grains, avec une légère baisse dans le baromètre.

Jusqu'au détroit de Torres j'ai eu le vent de la partie du S.E., le ciel presque toujours obscurci, ce qui rends l'approche du détroit dangereux faute de bonnes observations. J'ai passé Torres par le chenal de Bligh, qui dans mon opinion est le meilleur. Je n'ai usé que 48 heures pour le traverser, y compris deux nuits passées au mouillage. Seulement en venant de l'est sur Bligh's entrance, j'ai éprouvé un fort courant de 15 milles au O.N.O., et avec une brise un peu forte, il faut calculer sur 1 mille par heure selon le vent. Dans le détroit de Torres j'ai toujours eu le temps couvert, pluvieux, et de grains fréquents, me dérobaient à chaque instant la vue du ciel. J'y suis sorti par le Prince of Wales channel. J'ai observé un courant dans ce passage de 5 à 6 milles. Sur la partie est de N.O. reef (Prince of Wales channel), j'ai vu échoué et abandonné un navire (ship) Americain, dont je n'ai pas pu voir le nom. Le navire m'a paru de 1000 tonneaux, peint en noir, vergue d'hune simple, trois royale et un main sky yard. Toutes les voiles étaient dérangées. Le navire paraissait être échoué depuis peu de jours, mais il n'y avait personne à bord. En sortant j'ai passé près de terre et de Booby Island, et me suis assuré qu'il n'y avait pas de naufragés à terre. Probablement l'équipage de ce navire aura été sauvé par un navire passant avant moi.

Comme vous pourrez le voir par mon abstract log en quittant le détroit de Torres, j'ai passé par le mer de Banda, celle de Flores et de Java. Dans ces trois mers j'ai éprouvé beaucoup de calmes et de vents très variables. Je crois donc que j'aurais mieux fait de passer dans le sud de Timor, et d'entrer dans le mer de Java par un des étroits à l'est de cette île.

Le monson de S.E. m'a quitté dans le détroit de Tarimata. De ce passage jusqu'à Singapour je n'ai eu que des alternatives de calme et de brises bien variables. Je crois, Monsieur, vous avoir donné sur ma traversée tous les détails possibles. J'irai maintenant à Maurice, et je vous ferai également parvenir de ce dernier port l'extrait de ma traversée de Singapour à Maurice.

Agréez, Monsieur, &c., &c.,

TH. DE PREVOISIN.

187. In conclusion, I again express the hope that these few facts which I have introduced into the present report, will induce masters of ships and others interested in Navigation to co-operate with me in compiling the wind and current charts for the coast of Australia. Fully aware of the great difficulties we have to overcome in accomplishing the task which we have undertaken, I cannot but express my conviction, that the combined exertions of nautical men and those of an institution like this Observatory must be crowned with success. The entire want of instruments suitable for sea purposes, made it almost impossible to advance these objects further than has hitherto been done.

With the increasing importance of the Colony, the nautical interests will be enlarged, and will require the full attention of the Legislature. May the time not be far distant, when a complete system of Meteorology at sea will be organized on this coast, so as to secure to this Colony that share in the development of human knowledge to which she is entitled, from her rapid advances in civilization.

GEORGE NEUMAYER.

Flagstaff Observatory, October, 1859.

# TERRESTRIAL MAGNETISM.

---

## I.—INTRODUCTION.

188. The circumstances under which the present site of the Observatory was chosen are delineated in the preface to this report, and require no further illustration here ; suffice it to say, that previous to the erection of the Observatory, and throughout the whole year, observations have been made for the purpose of examining the nature of local influences, if there were any, and these observations will have to form a part of the explanatory remarks which will accompany the publication of the original observations. By these observations it was determined that the eastern portion of the hill was the most suitable for the purpose of magnetic investigations, and while the meteorological instruments were fixed on the western—the highest part of the enclosure—the various buildings required for the magnetic instruments have been erected where the hill inclines towards the east.

189. The geological formation on which the Observatory stands being decomposed basalt, covered to depths of ten to twenty feet with tertiary gravel, could not appear so unobjectionable as that on the southern banks of the River Yarra (silurian and tertiary), and it was for this reason that I strongly recommended to grant a piece of land on the elevation near the Botanical Gardens reserve, in which opinion I was confirmed, as above stated, by the results of a large number of preliminary observations made in different parts of Melbourne and its suburbs.

190. The buildings which form the Magnetic Observatory are :—

- (1.) The horary house.
- (2.) The absolute house.
- (3.) A round tower, used for astronomical observations.

The relative position of these buildings is as follows :—No. 2 and 3 are erected nearly upon the same meridian (astronomical), 184 feet distant from each other, the absolute house towards north ; and 150 feet from the latter towards S.E. the house is erected, in which the horary variations are observed. The levels of No. 2 and 3 differ from each other two feet, the absolute house standing lower, while the level of the ground round the horary house is three feet below the level of the latter. The description of the single buildings may be gleaned from the transactions of the Philosophical Institute, where I have given a full description of the Observatory, and follows hereafter.

191. *The Horary House.*—The house for observation on the horary motions in the three magnetical elements, “declination” or variation of the needle, “inclination” or dip of the needle, and horizontal intensity, is erected, or more properly speaking, sunk into the ground nearly in the centre of the present enclosure ; the hill inclines towards the south east. By placing this building in the centre, the object in view was, to prevent accidental disturbances as much as possible, and still to facilitate the communication with the different other buildings of the Observatory. The foundation is laid twelve feet below the surface, and consists of strong timber ; upon this are resting the double walls of a room containing the instruments for horary variations ; the ground plan of the room represents a polygram of sixteen sides, with a diameter of twelve feet, and the door towards N.E. ; a skylight in the centre of its pyramidal roof throws the light upon the mirrors underneath, and a flight of steps leads to the surface. The stands whereupon the instruments are placed consist of sand-stone, and are fixed in such a manner as to make it impossible that any motion could be communicated to them through the floor or the walls of the house from wind and other accidental vibrations ; the principal object in placing the instruments in this underground building is to prevent sudden changes in temperature, which would

necessarily have an influence upon the readings, although compensation for temperature is applied to the deflecting magnets. The stone pillar, carrying the tubes for the different instruments, is placed nearly in the centre of the room, and a second pillar is placed outside for the purpose of putting thereupon a collimator in order to check the unchanged position of the tubes and mirrors intended for the registration of the instruments. The material of this house, as well as that of the next one, is wood, and the joinings, nails, &c., &c., are of copper and brass, iron having been carefully avoided.

192. *The Absolute House*.—The house for measuring the absolute values of the magnetic elements is situated near the northern boundary of the enclosure in a N.W. direction from the former one. The ground plan of this building is a parallelogram; the axis of the same parallel with the longer side is in the magnetic meridian, and the entrance is towards the E. Two square stone pillars are erected in a similar way to those in the house before described; the instruments put upon these stones are a magnetic theodolite and a dipping circle, which receive the light necessary for reading them by a large skylight in the roof of the building. Different little openings are made through the walls, for the purpose of enabling the observer to take bearings towards well defined distant objects, the azimuth of which having been once carefully ascertained, will assist us in arriving sooner at a correct value of the declination than would otherwise be possible; one of those little openings brings this house in connection with—

193. *A Little Brick Tower*.—In the centre of this circular room a stone pillar is erected, upon which is placed a universal instrument, which is principally made use of for ascertaining the astronomical meridian and transferring it afterwards to the magnetic theodolite. The instrument is placed at such an elevation as to prevent the possibility of the observer's view being obstructed when engaged in taking terrestrial objects, and the revolving nature of the roof admits of observations being made in any part of the sky and towards any direction on the horizon; to enable the eye to be brought to the level of this instrument a circular flight of steps leads up to it; a second isolated pillar is erected near the steps, upon which are placed the chronometers, to bring them within reach of the observer.

194. The instruments in use at the Observatory, for determining the absolute values of the magnetic elements as well as the differential values, are those proposed and constructed by Professor Lamont, and there is no necessity of entering into the details of their construction as most elaborate descriptions of them have been published by that eminent philosopher in various works.—(*Handbuch des Erdmagnetismus*, Berlin, 1849; *Resultate des magnetischen Observatoriums in München während der dreijährigen Periode 1843, 1844, 1845, München, 1846*; *Beschreibung der an der Münchener Sternwarte zu den Beobachtungen verwandten neuen Instrumente und Apparate*, München, 1851; *Magnetische Ortsbestimmungen ausgeführt an den verschiedenen Punkten des Königreich Bayern*, München, 1854; *Untersuchung über die Richtung und Staerke des Erdmagnetismus an verschiedenen Punkten des Südwestlichen Europas*, München, 1858; *Untersuchung über die Richtung und Staerke des Erdmagnetismus in Norddeutschland, &c., &c.*, München, 1859.)—But an enumeration of the different instruments in my possession may follow here, most of which have been manufactured in the workshops of the Royal Observatory at Munich, except those otherwise described:—The Magnetic Theodolite, with a horizontal circle of 4·8 inches diameter—[Apparatus for measuring the absolute intensity by means of deflections E. and W. and N. and S.]; and for travelling purposes, the apparatus for observing deflections towards E. and W. only; apparatus for measuring the absolute intensity by means of oscillations, [with rings for determining the momentum inertiae of the different standard magnets, the oscillations are observed in a box of 14 inches square and 8 inches high, which is mounted upon a pillar in the N.E. corner of the absolute house]; in addition to these may be mentioned a very delicate balance, from the workshop of J. Lohmeir, in Hamburg, and several chronometers; a smaller oscillation apparatus must also be mentioned here, which is intended for use on the survey; apparatus for determining the absolute declination, [a larger one, with a thread of suspension four feet long, mounted in the N.W. corner of the absolute house,] and a smaller one which will be described when speaking of the methods of observing the absolute intensity. “Inclinatorium,” from the workshop of Inspector Meyerstein, in Göttingen, with a horizontal circle, 7 inches in diameter, and a dipping circle, divided upon glass; to this instrument belong four needles and an apparatus for inverting their poles; it is mounted on a stone pillar in the axis of the absolute house, 3 feet to the N. from the centre. “Differential Inclinatorium,” with soft iron bars. “The Horary Variation Instruments,” namely declinatorium, intensity apparatus, with deflecting magnet, compensated for temperature; and inclinatorium, with soft iron bars.—(Another

set of the same kind is about to be put up.) A universal instrument of Messrs. Ertel and Son, in Munich. In this list of instruments are also included such instruments as have not been in my possession during the period over which this report extends, but which arrived in the course of the year 1859-60, and are, for contra distinction, included in brackets. In addition to the instruments already named there is an apparatus for determining the value of a part of division in the variation instruments and for the coefficient of temperature of the standard magnets, a large collection of levels, scales, heliotropes, &c., &c.

195. The various buildings forming the Observatory for Terrestrial Magnetism were not completed, and the instruments were not in perfect working order until the middle of July, 1858, when the absolute observations could be taken up, but the hourly observations were systematically registered since the first of May, of the same year, and since then have never been interrupted for a moment. The simultaneous readings of the variation instruments and those of absolute measurements were greatly facilitated by means of an electric bell leading from the absolute house to the horary house. As a general rule, the determination of the absolute values of the magnetic elements was carried out once a month; deviations from this, however, had to be made on several occasions, according to circumstances. Whenever indications were observed of magnetic storms or whenever the sky showed traces of an auroral discharge, the variation instruments were registered most minutely, as can be seen by the observations given in that part of the report treating on the Aurora Australis and magnetic storms.

## II.—HORIZONTAL INTENSITY.

196. As mentioned in the introductory remarks, there was no apparatus in my possession, during the first year of the existence of the Observatory, by means of which I could determine the absolute values of the intensity; I had to make use of a differential apparatus, of which the constants had been ascertained at the Royal Observatory, Munich, during my stay there in the years 1855-56. Two magnets, the logarithms of the constants of which were, for No. 1, 0.78115, and for No. 2, 0.78651, have invariably been used for deflections and oscillations, and it may be here stated that the unit, in which the intensity is expressed, is that of Gauss, in millimeters and milligrams. The dimensions of the magnets are as follows:—

|                | m.m. |     | m.m.     |            | m.m. |
|----------------|------|-----|----------|------------|------|
| No. 1, length, | 96.3 | ... | breadth, | 8.8        | ...  |
|                |      |     |          | thickness, | 3.0  |
| No. 2, „       | 96.3 | ... | „        | 9.0        | ...  |
|                |      |     |          | „          | 3.0  |

If  $C$  signifies the constant of a magnet,  $T$  the duration of oscillations reduced to infinitely small arcs,  $\phi$  the angle of deflections corrected for inequality of angles,  $\beta$  and  $\beta'$  the coefficients of expansion for brass and steel respectively,  $\alpha$  the coefficient of temperature for the magnet, and  $t$  and  $t'$  the temperatures observed during the oscillations and deflections, we have, according to Lamont—

$$x = \frac{C}{T \sqrt{\sin \phi}} \left( 1 + \beta' t - \frac{3}{4} \beta t' + \frac{1}{2} \alpha [t - t'] \right)$$

The coefficients of temperature of each magnet was frequently ascertained and found to be for—

|                |           |
|----------------|-----------|
| Magnet. No. 1, | 0.0003484 |
| „ No. 2,       | 0.0003788 |

By involving in the above equations the coefficient of expansion for brass,  $\beta = 0.0000235$ , and for steel,  $\beta' = 0.0000135$ , we obtain the following logarithmic equations:—

$$\begin{aligned} \text{No. 1, } \log. x &= 0.78115 - \log. T - \frac{1}{2} \log. \sin \phi - 0.0000095 t + 0.0000815 (t - t') \\ \text{No. 2, } \log. x &= 0.78651 - \log. T - \frac{1}{2} \log. \sin \phi - 0.0000095 t' + 0.0000881 (t - t') \end{aligned}$$

The temperatures are to be expressed in Réaumur degrees. It should also be mentioned that the readings of the variation instruments have been taken into consideration and corrections applied, since the time when the horary house was in working order, and the results given in the following have been derived from observations which had been previously reduced to Zero of the intensity scale.

197. *Deflections.*—It has been mentioned above that the deflections were only observed “E. and W.” The beam by which this was effected measured, between the two rests, 280.8m.m., and the dimensions of the freely suspended needle are—

|           | m.m.  |     | m.m.       |              | m.m.  |
|-----------|-------|-----|------------|--------------|-------|
| Length, = | 74.25 | ... | breadth, = | 7.4          | ...   |
|           |       |     |            | thickness, = | 4.95. |

The correction  $\rho$ , applied to the angle of deflection, for inequality of angles, was computed by the formula—

$$\rho = - 1.0472 \left( \frac{1}{8} \tan \phi + \frac{1}{6} \cot \phi \right) \Delta \phi^2$$

where  $\Delta \phi$  signifies the inequality of the deflections expressed in degrees. If the readings of the deflections towards W. are  $\nu_1 \nu_2$  and those towards E. are  $\nu_3 \nu_4$  then  $\Delta \phi_1 = \nu_1 - \nu_2$  and  $\Delta \phi_2 = \nu_3 - \nu_4$ . The manner in which the observations have been made is illustrated by the accompanying deflection observations, for which the correction  $\rho$  has been computed and entered in the column headed “Correction for inequality of angles.”

## 198. DEFLECTIONS.

NOTE.—A series of equal altitudes of the sun having been taken, the azimuths of the above mentioned points of reference were ascertained to be as follow: Williamstown Lighthouse, S. 24° 48' 29" W.; Batman's Hill Signal, S. 22° 14' 36" E. The weather was oppressively hot during the whole of the observations, a gentle breeze blowing from N.N.E., which after 4 o'clock p.m. shifted towards S.S.E.

NOTE.—A series of six observations of the altitude of the sun's lower limb having been taken with Ertel's Universal Instrument, the azimuths of different objects have been ascertained and reduced to the magnetic theodolite: Azimuth of Williamstown Lighthouse, 54° 4' 85" W. The weather was very hot, and a fierce wind blowing from the North.

## 200. DEFLECTIONS.

NOTE.—With the view of determining the suitability of the Flagstaff Hill as a site for an Observatory, the instrument was put successively in thirteen different stations during the period from December the 23rd, 1857, to January the 1st, 1858; but as these observations have to be published elsewhere, only the series of observations taken on the 26th of December, in the Old Flagstaff Reserve, need find a place here.

NOTE.—By bearings taken to the Universal Instrument, at the Flagstaff Observatory, the following azimuths have been determined :—  
Williamstown Lighthouse .. .. S. 24° 55' 38" W.  
Batman's Hill (Trig. Station) .. .. S. 22° 2' 12" E.

216. OSCILLATIONS.

The following series of observations on the duration of oscillations for magnets No. 1 and 2 was made partly in the field, partly in the absolute house ; in both cases, the little box having been screwed to the magnetic theodolite. In every one of these sets every *third transit* was observed, and the reduction to infinitely small arcs was effected according to the following principles :  $T = \frac{T'}{1 + \frac{1}{16} h_2}$  the oscillating magnet being under the influence of terrestrial magnetism only.  $T'$  signifies the mean of the observed intervals, and  $h$  the arc of oscillation at the  $M^{\text{th}}$  oscillation.

The manner in which the subsequent observations were made, is best understood by looking over the single sets, and it becomes evident that every one for itself offers a means of determining the number of oscillations  $M$ , at which the reduction arc had to be observed ; as  $\frac{h_1}{h_{100}}$  can be derived from two consecutive series, being 100 oscillations distant from each other, and  $h_1$  and  $h_{100}$  signifying the arc of oscillation for the first and the hundredth oscillations.  $M$  was determined nearly with every single set, and the work was greatly facilitated by a small table having been computed, containing the reductions for each arc of oscillation observed at the  $M^{\text{th}}$  oscillation for magnets No. 1 and No. 2.

217. OSCILLATIONS WITH MAGNET No. 1, OBSERVED 25TH FEBRUARY, 1857.

Simultaneously with the oscillations of magnet No. 1 the differential instruments were observed and the mean of the readings was equal to — 0.2. Simultaneously with the oscillations of magnet No. 2 the differential instruments were observed, and the mean of the readings was equal to 0.0. Simultaneously with the oscillations of magnet No. 2, second series, the differential instruments were observed and the mean of the readings was equal to + 0.2.

Time of commencement of this series 11h. 44m. 44s. a.m.

These observations belong to Deflections from No. 242 to 254.

Simultaneously with the oscillations of magnet No. 2, the following readings of the differential instruments were obtained :—

1.6  
-0.95, -0.95, -1.0, -1.6, -1.65, -1.7, -1.7, -1.7, -1.7, -1.8, -1.8, -1.8, -1.85, -1.95, -1.95.

Simultaneously with the oscillations of magnet No. 1, the following readings of the differential instruments were obtained :—

-1.1, -1.6, -1.1, -1.1, -1.1, -1.05, -1.1, -1.1, -1.1, -0.95, -0.95, -0.95, -0.95, -0.95, -0.9, -0.85.

223. OSCILLATIONS WITH MAGNET No. 2, 6TH-NOVEMBER, 1858.

Time of commencement of this series, 2h. 31m. 51.5s. p.m. This series of observations belongs to the Deflections from No. 412 to 422.  
Simultaneously with these observations readings of the differential instruments were taken, the mean value of which was found to be +17.5.

227. By examining the different sets of deflections and oscillations, we perceive that a set of the one could not in every case be combined with a set of the other, as time or other circumstances did not always permit both observations to be taken. For this reason a quantity  $\mu$  proportional to the magnetic momentum of the deflecting magnet was determined by computing the results from any available complete set of observations (deflections and oscillations).

$$\mu = \frac{\sqrt{\sin. \phi}}{T} \left( 1 + \beta' t + \frac{3}{2} \beta t^2 + \frac{1}{2} \alpha (t + t') + \frac{1}{2} (m' - m) i \right)$$

In this formula, the different letters represent the same quantities as stated in 196, and there is only to be added that  $m$  and  $m'$  denote the corresponding readings of the variation instrument for Horizontal Intensity, and  $i$  the value of a part of division in that instant, which in our case (see Horary Variations) is 0.000149 of the total value. According to these principles, the following table has been computed, giving for different periods, since September, 1855, the value of  $\mu$  for Magnet No. 1 and No. 2, and showing the decrease in the magnetic momentum.

MAGNET No. 1.

228. The quantity  $\mu$  was taken out from this table by interpolation for the time of observation, and was substituted in the following equation :—

$$x = C. \frac{\mu}{\sin. \phi} (1 - (3\beta + \alpha) t')$$

according to which the observations have been computed in such cases, where only deflections had been observed.

229. The following contains a series of results derived from the foregoing observations, which have been made in different localities in or near town. As the magnetic instruments for observing the hourly variations had not been in working order previous to the 1st of May, 1858, the results could not be corrected for hourly variations and reduced to mean values, but are to be understood for the time of observation :—

FEBRUARY 25TH, 1857.—North Melbourne.

Magnet No. 1 ..... 2·3800 oscillations and deflections.

Magnet No. 2 ..... 2·3801 deflections only.

SEPTEMBER 26TH, 1857.—Observatory Hill.

Magnet No. 1 ..... 2·3698 deflections and oscillations.

Magnet No. 2 ..... 2·3699     "     "

OCTOBER 1ST, 1857.—South Yarra, Church of England Reserve.

NOTE.—In this table two asterisks annexed to the value for a period signify that Magnetic Storms occurred during the period, and one asterisk only, indicates that disturbances of a minor character were observed. The means for the different quarters have been derived from the means for the periods forming the quarter, and not from the months.

The mean value of the Horizontal Intensity for the period between July the 30th, 1858, and February the 24th, 1859, as derived from the means of the single periods is 2·3605 in Gauss's unit, or 5·12136 in the English unit.

### III.—MAGNETIC DECLINATION.

#### *Variation of the Needle.*

231. The observations on the declination of the needle have been made with the magnetic theodolite, two different methods having been applied for this purpose. In the first place the quantity was absolutely ascertained with the help of a magnet 4·84 inches long, and weighing 970 grains. The same consists of two separate magnets, joined together in such a manner that they do not come in contact with each other. Between these two halves the mirror is fixed, parallel, or nearly so, to the axis of the magnet, and a line passing through the two points of suspension. These two points are required in order to enable the observer to invert the position of the magnet, with the view of eliminating the “collimation of the mirror.” When used, the magnet is enclosed in a suitable case, which can be screwed to the theodolite; the thread of suspension, unspun silk, is from 24 to 26 inches long; an index attached to the thread enables the observer to ascertain the torsion of the thread. The manner in which this is effected can best be learned by inspecting the observations following below; and there is only to be further remarked, that for this purpose use is made of a torsion weight, to which a small magnet is fixed. This instrument has not been used in the field, but in the “absolute house” only, where every precaution could be taken to secure and to check the unchanged position of the same. From the pillar upon which the theodolite is placed various distant objects can be observed, and through a small window towards the south, bearings can be taken towards a “universal instrument” placed in a round brick tower. By this arrangement the position of the astronomical meridian could easily be transferred from the above mentioned “universal instrument” to the magnetic theodolite, thus greatly facilitating the determination of the azimuths of various well defined distant objects.

232. The determination of the meridian with the universal instrument has been frequently repeated, as well as the transfer to the magnetic theodolite, and the following azimuths, as seen from this instrument have been ascertained by a great number of single observations:—

|                                                 |     |     |    |     |       |    |
|-------------------------------------------------|-----|-----|----|-----|-------|----|
| Lantern of the Lighthouse in Williamstown       | ... | ... | S. | 30° | 1·79  | W. |
| Trigonometrical Station on the Dandenong Ranges | ... | ... | S. | 86° | 50·00 | E. |
| Spire of Chalmers' Church on Eastern Hill       | ... | ... | S. | 85° | 41·96 | E. |

The collimation of the circle of the magnetic theodolite was invariably ascertained before and after the observations on the position of the magnetic meridian, by means of bearings to the above marks.

233. The observations on the absolute magnetic declination could not be commenced until the beginning of August, 1858, when the “absolute house” was so far advanced as to admit of a long series of observations being taken.

Observations have been made—

1. On the 7th of August, 1858.
2. „ 4th of September, 1858.
3. „ 25th of November, 1858; and
4. „ 25th of January, 1859.

Here may follow the original readings, with those of the differential instruments placed alongside.

238. The second method applied for ascertaining the magnetic declination is a differential one, and was frequently made use of. For this purpose the magnetic theodolite was used as well, but with a smaller magnet attached to it, which is also used for determining the horizontal intensity. The torsion was in this case ascertained by the help of deflections.

If  $V$  signifies the reading of the magnet, when undeflected,  $\frac{1}{2} (u_1 + u_2)$  the corrected arithmetical means of the readings of the magnet, when deflected east and west of the meridian—and lastly  $\phi$  the angle of deflection—we have for  $\delta$  or the correction for torsion.

$$\delta = \left[ V - \frac{1}{2} (u_1 + u_2) \right] \frac{\cos \phi}{2 \sin^2 \frac{1}{2} \phi}$$

As the magnet in this apparatus cannot easily be taken out, and no arrangement has been made to invert the magnet, the collimation of the mirror attached to it could not be eliminated in the way described in the first method, but had to be ascertained and brought into account. This was effected by taking simultaneous observations with the above described apparatus, and the last one. After having applied every correction required to the readings according to both methods, the difference between the two results will give the collimation of the mirror in the intensity apparatus.

The fact, that previous to the 7th of August, 1858, the declination could not be determined absolutely, but only with the differential apparatus, renders it desirable that it should be shown, that this collimation of the mirror is not subject to irregular and very considerable changes, if the apparatus is properly treated, and for this reason I subjoin here the following results on its determination at different periods.

During the month of September, 1855, the value of the collimation of the mirror was derived from observations at the Royal Observatory at Munich, and was found to be  $+37.46'$ . A subsequent observation made at Hamburg on the 11th of July, 1856, gave the same value, while the following shows the value of the same quantity derived from observations taken in the absolute house of the Observatory at different times.

*On the 6th of August, 1858*, from observations taken with the differential apparatus, the collimation of the mirror was  $+38.25'$ ; if we make use of those deflections only, made with magnet No. 2 (166—179); and

*On the 5th of September, 1858*, it was found to be  $+38.86'$ ; while on the 30th of November, 1858, and the 27th of January, 1859, it amounted to  $+39.84$  and  $+39.71$  respectively.

239. Applying these values to the reading of the magnet in the differential apparatus, the greatest part of the deflection observations, as given above, have been made use of, in order to increase the number of observations on the declination at the different periods, and the following is a summary of the results obtained:—

*On the 25th of February, 1857*.—The magnetic theodolite was fixed on a rising ground in North Melbourne, off Stanley-street, free from local influences; from deflection observations, No. 1 to 25, the declination of the needle was, at 4<sup>h</sup>. 18<sup>m</sup>. p.m.,  $8^\circ 33.3' E$ .

*On the 25th of September, 1857*.—The place of observation in this case was on the hill near the Botanic Gardens, and from observations No. 26 to 48, the declination was found to be  $8^\circ 46.03' E$ . at 4<sup>h</sup>. p.m.

When it was determined that the Flagstaff Hill should be selected as the site for the Observatory, observations were frequently made, of which those only, made on the 26th of December, 1857, viz: No. 90 to 115, may be quoted here. The time of observation was early in the morning, and during the latter part of the observations a heavy gale of wind commenced to blow from the north. The result was  $8^\circ 14.82' E$ .

The whole of these results are to be understood without regard to horary variations, as no observations with differential instruments were available at that time.

240. The readings of the variation instrument have been classified in periods of ten days duration, and from simultaneous observations, made partly with the absolute apparatus and partly with the differential one, the following table has been computed.

MAGNETIC DECLINATION DURING THE PERIOD BETWEEN 1<sup>ST</sup> MAY, 1858, AND 24<sup>TH</sup> FEBRUARY, 1859.

| PERIODS.                          | VALUE<br>OF<br>DECLINATION. | MONTHS.   | VALUE<br>OF<br>DECLINATION. | QUARTER.                              | VALUE<br>OF<br>DECLINATION. |

## NOTES.

\*\* \* In this Table two asterisks annexed to the value for a period signify that Magnetic Storms occurred during the period, and one asterisk only, indicates that disturbances of a minor character were observed.

<sup>1</sup> During this period rain fell to a great depth on the 11th and 12th of September, which might have caused a slight error of the reading, as there was a great deal of water underneath the floor of the horary house.

<sup>2</sup> On the 13th of November an inundation round the pillars caused great disturbances in the readings of the instruments.

<sup>3</sup> The immensely heavy fall of rain on the 20th, 21st, and 22nd, caused apparently in this case the great irregularity in the value of the magnetic declination.

<sup>4</sup> On the 9th and 10th of January water collected round the pillar of the instrument, caused by a considerable fall of rain.

<sup>5</sup> The heavy fall of rain on the 26th of January seems to have influenced the above value.

The means for the quarters and also for the year have not been ascertained from the means for the single months, but from the periods, rejecting every one of them which could be thought objectionable on account of some undue influence. According to these principles the mean magnetic declination was found to be 8° 30' 01" E. for the period between the 1st of May, 1858, until the 24th of February, 1859.

241. After having stated my intention, in the introductory remarks, not to publish fragments of the magnetic survey it might appear inconsistent to give, in this paragraph, the magnetic declination for various localities, but the fact, that these values are very important for practical surveying, induced me to subjoin the table following below. The observations have been corrected for hourly variations by using the readings of the differential instrument at the Flagstaff Observatory, and it was in this case not thought desirable to reduce the results to one and the same moment of time, but to give the mean values for each respective day of observation. In most cases the astronomical meridian was ascertained by means of observations taken with a universal instrument from the workshop of Messrs. Ertel and Son, of Munich; whenever a different mode had to be adopted mention thereof will be found amongst the notes at the foot of the table.

TABLE SHOWING THE MAGNETIC DECLINATION (VARIATION OF THE COMPASS) FOR DIFFERENT LOCALITIES IN THE COLONY OF VICTORIA.

(N.B.—Only those localities can appear in this Table for which the reduction of the magnetic observations, or the observations themselves, have been completed already.)

| NAME OF LOCALITY.                                  | TIME OF OBSERVATION. |               |            | VALUE OF THE MAGNETIC DECLINATION. |                                             | REMARKS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                                    |                      |               |            |                                    |                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

<sup>1</sup> The universal instrument was put up with such a view as to facilitate the transferring the meridian of the same to the stations at Blackhill and a hill N.W. of Blackhill, by means of heliotrop signals.

<sup>2</sup> The collimation of the circle of the magnetic theodolite was ascertained by means of bearings towards the altazimuth instrument in the Observatory, in which Mr. Ellery kindly assisted.

<sup>3</sup> In these cases the collimation of the magnetic theodolite was ascertained by means of a vertical circle, which could be screwed on to the magnetic theodolite.

<sup>4</sup> Through the kindness of Mr. Surplice I was permitted to make use of the 5-inch theodolite, in his possession, with which the necessary observations for determining the meridian have been carried out.

<sup>5</sup> The collimation of the circle was ascertained by bearings towards the universal instrument at the Flagstaff Observatory, but as it was impossible to see the Observatory from the station a third instrument was put up for the purpose of transferring the bearings.

<sup>6</sup> As in No. 2; the magnetic observations have been taken when the magnetic elements were disturbed by the effect of an Aurora Australis, which had been observed during the morning.

<sup>7</sup> On the morning of the 14th December the magnetic elements were greatly disturbed by the display of an Aurora Australis; hence the great difference between the mean of the day and the value of the declination at the time of observation.

#### IV.—MAGNETIC INCLINATION.

242. The observations made on the dip of the needle were made with an inclinorium, from the workshop of Inspector Meyerstein, of Göttingen, and it appears desirable to add some few explanatory remarks, tending to illustrate the construction of the instrument and the different modes of observation. The vertical circle, of 9·8-inch diameter, is divided upon a fine mirror, 11 inches square, the single degrees being subdivided into 4 parts, each of the latter therefore represent 15 min. of arc; this mirror forms the back part of a wooden box, the fore part of which is provided with glass, so as to protect the needles against the influence of currents of air and still to admit of an easy reading of the instrument; the horizontal circle is 6·7 inches, and is divided upon silver, reading to one minute with the assistance of two Verniers. The needles used for determining the magnetic inclination are 9·5 inches long, and weigh 254·5 grains, their axles are of steel, and rest, when in working order, upon layers of agate; the reading was invariably effected by keeping the eye in a line with the image produced by the point of the needle in the mirror and the point itself, thus avoiding errors of parallax; a magnifying glass was used to insure greater accuracy.

243. Four needles, belonging to this apparatus, are used alternately, and the polarity of them can easily be inverted with the help of two bar magnets; these needles are kept in two boxes, I. and II., the one end of the former is marked A I. and A II., while the other end bears the mark B, both of these marks being on one and the same side; whenever the marked side is facing the divided circle the position of the needle is called "Mark inside," while "Mark outside" signifies that the marked side faced the observer. Several different methods have been applied with the view of eliminating the error of inequality of the diameter of the axles and the non-accordance of the magnetic and the mechanical axis of the needle; in all methods, however, the following principles have been strictly adhered to:—

- (1.) The instrument was carefully adjusted.
- (2.) The observations were made "Mark inside" and "Mark outside."
- (3.) The observations were made with the divided circle towards E. and towards W. (C.E. and C.W.) [It becomes necessary, however, to state here, that, strictly taken, this can only apply to observations in the meridian, and when out of the meridian it merely signifies that the two observations have been made in the same azimuth, the positions of the dipping circle being 180° different.]
- (4.) Both ends of the needle have been read in parts of division (15 min.) and tenth and hundreth, and the mean taken.
- (5.) The polarity of the needles has been inverted and an equal number of corresponding readings taken with A South and B South. [Particular care has been taken to change the magnetic moment of the needle as little as possible.]

244. Adhering to these principles the following different modes of observation have been applied:—

- (A.) The dipping circle was placed in the magnetic meridian, which was determined either by a "declination" needle or by an "inclination" needle [when the needle is pointing perpendicularly, and in this latter case all different points enumerated in the foregoing paragraph have been strictly observed].
- (B.) The magnetic meridian was carefully determined and a great number of observations was taken all round the compass, or only within several points to both sides of the meridian. The inclinations ( $I$ ) observed in the magnetic azimuth ( $\alpha$ ) have been reduced to the meridian by the following formula:—

$$\text{Tang. } I = \text{tang. } I_0 \cos. \alpha$$

- (C.) The azimuths where chosen in equal intervals all round the circle, without regard to the magnetic meridian, and the reduction of the observed inclination was effected by the following formula:—

$$\cotg.^2 I = \frac{2}{n} (\cotg.^2 I_0 + \cotg.^2 I_1 + \dots \cotg.^2 I_{n-1})$$

245. I subjoin here different sets of observations, to explain more fully the modes of observing that I had adopted.

DETERMINATION OF THE MAGNETIC INCLINATION AT WILLIAMSTOWN, ON THE 30TH OF JANUARY, 1857.

NEEDLE A I., Box I.

(Meridian ascertained with Declination needle and Inclination needle.)

B NORTH.

9h. 50m. a.m. C.E. 22° 3'85 parts, "Mark outside;" 22° 2'5 parts, "Mark inside."  
9h. 52m. a.m. C.W. 337° 1'60 parts, "Mark outside;" 337° 2'0 parts, "Mark inside."

B SOUTH.

10h. 3m. a.m. C.E. 22° 3'0 parts, "Mark outside;" 22° 1'0 parts, "Mark inside."  
10h. 5m. a.m. C.W. 337° 2'6 parts, "Mark outside;" 337° 0'8 parts, "Mark inside."

NOTE.—This observation on the dip of the needle was made three days after my arrival in the Colony (27th of January, 1857), and the place of observation was near the old lighthouse, on basaltic formation. Whenever the Inclinatorium was used in the open air it was mounted upon a tripod; while in the Absolute house it occupied the pillar described in the introductory remarks.

246. DETERMINATION OF THE MAGNETIC INCLINATION IN NORTH MELBOURNE (STANLEY STREET), ON THE 26TH OF FEBRUARY, 1857.

NEEDLE A I. Box I.

(Meridian ascertained with Declination needle and Inclination needle.)

B SOUTH.

C.E. 22° 3'8 parts, "Mark inside;" 23° 0'3 parts, "Mark outside."  
C.W. 336° 3'5 parts, "Mark inside;" 337° 1'1 parts, "Mark outside."

B NORTH.

C.E. 23° 1'1 parts, "Mark inside;" 22° 3'6 parts, "Mark outside."  
C.W. 337° 2'5 parts, "Mark inside;" 337° 1'4 parts, "Mark outside."

247. ABSOLUTE MAGNETIC INCLINATION IN THE MAGNETIC MERIDIAN AND ROUND  
THE HORIZON, 1ST APRIL, 1857.

(In the Yard of the University.)

Determination of the Magnetic Meridian ... { C. E. 185 26.50

| On the 9th November.          |              |                 |       |                              |      |         |               |                 |       | On the 12th November.         |      |         |              |         |        |                              |      |         |  |

252. The variation instrument for observing the inclination was frequently out of order during the first six months of the working of the Observatory, partly on account of the settling of the pillar whereupon the instrument was mounted, partly on account of the irregularities in the quantity of magnetism in the soft iron bars. For this reason a classification of the different results into periods of ten days was not deemed desirable, and I subjoin here instead of such mean values the values of the dip of the needle for the single days of observation.

- On the 30th of January, 1857, Williamstown Old Lighthouse, 67° 23'7" South.
- On the 26th of February, 1857, North Melbourne, Stanley-street, 67° 6'8" South.
- Between the 1st and 4th of April, 1857, Yard of University, 67° 3'22" South.
- Between the 2nd and 3rd of September, 1858, Absolute House, 67° 18.09' South.
- Between the 9th and 12th of January, 1859, Absolute House, 67° 20'7" South.

253. The number of days on which observations on the dip of the needle have been carried out would be considerably increased, if we take into consideration the results derived from observations with the Differential Inclinatorium of Lamont ; but I avoid giving any observations here, as I shall have to publish them elsewhere suffice it therefore to mention some results, which are well calculated to illustrate the reliability of the instrument, and its high value for simplifying the methods for observing the Magnetic Inclination.

On the 4th of April, 1857, the inclination of the needle was observed with the Differential Inclinatorium. The angle of deflection, when reduced, was found to be 28° 58'05."

On the 3rd of November, 1855, observations with Meyerstein's Inclinatorium at my Observatory, at Frankenthal, in the Palatinate, gave the inclination 66° 10'0" North, and the Differential Inclinatorium gave an angle of deflection, when reduced, of 27° 36'85."

Again, on the 23rd of July, 1856, when passing through Hamburg on my way to this colony, the inclination was observed to be (Meyerstein's instrument) 68° 25'31" North, and an angle of deflection, when reduced, of 31° 9'9." Combining these two results with the observations made on the 1st of April, 1857, in the yard of the University, we obtain a value for the inclination, as derived from Frankenthal, 67° 4'80" South, and as derived from Hamburg, 67° 4'30" South ; the mean value of these, 67° 4'55," differing only 1'33" from the absolute results above given.

V.—HOURLY VARIATIONS.

254. As all the necessary remarks for the explanation of the arrangements, instruments, and modes of observation, with special regard to the hourly variations in the different elements of terrestrial magnetism have already been made in the introductory paragraph of this Report, it only remains to be observed, that the values of a part of division for the different instruments have been on several occasions carefully ascertained, viz., on the 9th of July, 1858, 5th, 6th, and 7th of January, 1859.

I avoid giving here the original observations thereon; suffice it to mention the values as computed from the different sets.

*For the Declination Instrument.*—Value of a part of division 0·803 minutes.

*For the Horizontal Intensity Instrument.*—Value of a part of division 0·000149 in parts of the total value.

*For the Inclination Instrument.*—Value of a part of division 0·441' n" + 0·123' n' where n" signifies the number of parts of division of the inclination instrument, and n' that of the intensity apparatus.

These values have been ascertained by taking the value of the torsion of the threads of suspension into consideration, and the angle of deflection was for intensity 50° 22,' and for the inclination 47° 34.'

255. DECLINATION.

The following table (I.) contains the results, from hourly observations, on the variations in this element of Terrestrial Magnetism, during the ten months of observation, reduced to the minimum value in each month.

(I.) HOURLY VARIATIONS OF THE MAGNETIC DECLINATION FROM 1ST MAY, 1858, TO 28TH FEBRUARY, 1859.

| MONTH.       | MIDNIGHT. | 1    | 2    | 3    | 4    | 5    | 6    | 7    | 8    | 9    | 10   | 11   | NOON. | 1     | 2     | 3     | 4     | 5     | 6     | 7     | 8     | 9     | 10   | 11   | MIDNIGHT. | 1    | 2    |
|--------------|-----------|------|------|------|------|------|------|------|------|------|------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|------|------|-----------|------|------|

NOTE.—The values in Tables I. to VI. are given in parts of division of the scale, the values of which were stated in section 200.

257. The instrument for ascertaining the hourly variations in the Magnetic Inclination, was occasionally out of working order, on account of the unsettled state of the pillars upon which the same was placed, and it was thought advisable not to include in the present Report any results of observations made with this instrument, the time of observation being too short. It was considered the more advisable to do so, as the original observations will be printed in full.

## VI.—AURORA AUSTRALIS AND MAGNETIC STORMS.

---

258. For the development of the theory of Terrestrial Magnetism, nothing can be of greater importance than the study of the disturbances in the elements of our earth's magnetism, which take place so suddenly and apparently without regularity. A complete calendar of these Magnetic Storms, together with the circumstances under which they occurred, will therefore be a valuable addition to this Report.

259. All possible attention was paid to the phenomenon of Polar Lights, so intimately connected with magnetic storms, and no opportunity was lost to establish the fact of their display whenever the magnetic elements showed irregularities. In this object the labors at the Observatory have been greatly assisted by the logs of experienced masters of ships, which contained observations made in higher latitudes with reference to this matter.

260. The recognition of an Auroral Light, when there are but faint traces visible, or in case the moonlight interferes with the observations, is in latitudes like ours a matter of considerable difficulty, and requires practice and care. The best criterion for distinguishing an Auroral Light is offered by the oscillating motion of the luminosity in a horizontal direction near the S.E. and S.W. horizon—that is, if the luminosity of the sky moves between several points of the compass, and if this oscillating motion continues while the phenomenon is visible, one may always be sure to have to do with an auroral discharge, even if no scintillation could be observed.

261. The cirro stratus veil so frequently spreading over the sky in this country is but too apt to deceive an inexperienced observer, particularly so if the sky should be illuminated by the light of the moon and stars, but the mode of observation above referred to will at once determine what is to be thought of this kind of luminosity.

262. It was thought advisable to enumerate also some displays of Aurora Australis which had been carefully observed previous to the time when the systematical registrations at the Observatory commenced, and further to add to this list as many other simultaneous occurrences in this direction as could possibly be established.

263. *January the 17th, 1857, Lat. 51° 8' S., Long. 111° E.*—Extract from the log of the ship *La Rochelle*.—Throughout the evening a splendid Aurora Australis was visible, most vivid streamers of light constantly playing on the southern horizon; the greatest brilliancy of the phenomenon was at midnight, when a wide arc extended over the sky from W. to S. by E. per compass; the motion of the arc was about 35°; the streamers reached at times an altitude of 60°; shortly after sunset the dullness of the stars of first magnitude was remarkable, so much so, that while the horizon was apparently quite strongly defined, altitudes of  $\alpha$  and  $\beta$  Centauri and Venus could not be measured with any degree of accuracy, although two observers were engaged in doing so.

264. *January the 19th, 1857, Lat. 49° 15' S., Long. 118° E.*—Extract from the log of the ship *La Rochelle*.—Frequent streamers of light emanating from the south, and continuing for several hours throughout the evening, although with by far less brilliancy than on the former occasion.

265. *December the 17th, 1857, South Yarra, near Melbourne.*—At 8<sup>h</sup>. 50<sup>m</sup>. p.m. the first traces of an Aurora Australis was seen—an arc extended from S. E. by S. to S.W. by W., rising to an altitude of 12° in the Magnetic South. The first streamers appeared in S.S.E., and gradually extended towards S.W., attaining at 9<sup>h</sup>. 20<sup>m</sup>. a considerable brilliancy, when the S.W. horizon was covered with red streamers, reaching as high as Fomalhaut. The red color of the streamers was almost entirely confined to the western part of the phenomenon. At 9<sup>h</sup>. 40<sup>m</sup>. the luminosity again moved towards E., and reached its greatest amplitude in S.E. by S. The streamers attained an altitude of 75° when emanating in the astronomical meridian, and the smaller Magellan cloud could not be distinguished when the streamers passed it, while the larger one, though visible, appeared to be greatly reduced in size. At 9<sup>h</sup>. 50<sup>m</sup>. the phenomenon took up the whole portion of the horizon between S.E. by S. and S.W. by W., and the scintillations of the streamers were then most beautiful. About 15° above the horizon a column of red light appeared in S.S.W., which was enclosed between two parallel streamers, and remained so for a considerable time. Numerous cirro cum. clouds were now scattered over the southern horizon, and at 10<sup>h</sup>. 5<sup>m</sup>. a

similar column of red light as above described made its appearance in W.S.W. 30° above the horizon; at 10<sup>h</sup>. 30<sup>m</sup>. the phenomenon was brightest in S.S.W. though much decreased in brilliancy, and at 11<sup>h</sup>. the display of streamers was almost entirely confined to the magnetic meridian; although the Auroral Light became at times very weak, the coruscation of streamers became very great at midnight, occupying at that time more the eastern horizon; the phenomenon continued to play with more or less brightness during a few hours of the morning of the 18th; it is a fact worthy of notice, that the cirro cum. clouds disappeared more and more as the phenomenon extended over a greater portion of the horizon.

266. *April the 10th*, 1858.—Splendid Aurora Australis at 3<sup>h</sup>. a.m. I give below the description of this phenomenon, as published by me in the daily papers of the 20th of April, 1858.—Until 2<sup>h</sup>. 30<sup>m</sup>. on the morning of the 10th, the whole of the sky was overcast with dense clouds, and the temperature of the air was moderate; at about that time the clouds began to clear away from the E. and N.E., and the temperature rapidly to sink; at 5<sup>h</sup>. the thermometer stood at 45·5° F.; nothing particular was observed in the southern part of the sky until the time of the 3 o'clock registration, when the first rays of an Aurora became visible on the S.W. horizon; in a few minutes the whole of the southern sky from S.S.E. to W.S.W. was filled with a most brilliant display of this phenomenon; the most remarkable portions were those in the W.S.W. and the magnetic south, in the former to nearly as high as Algorab, or about 35°; the whole of the heavens appeared of a beautiful pink color, and remained so almost for the duration of the phenomenon; in the latter a column of light ascended from the horizon at an angle of 75°, passing through the constellation of Argus between δ and β, reaching an altitude of 20°; this column was in the form of a parallelogram of considerable breadth, and was distinctly defined on its upper extremity by a line parallel to the horizon; for about 15 minutes it retained almost its original form, during which time brilliant scintillations continued to shoot up in a most beautiful manner, the streamers however rarely exceeding 30° in altitude and only extending their play from S. 22° E., to S. 86° W.; the pink color of the rays was nearly all confined to the western portion of the phenomenon; whenever a pause occurred, the luminous action always commenced in the west and extended gradually towards the east; during the whole of the occurrence—continuous observations having been made on the magnetic instruments—great disturbances were perceived in all the three elements of terrestrial magnetism; during the display the electrical tension was frequently observed, and nothing extraordinary perceived; the tension was found to be 3·00 positive according to the electrometer of M. Quetelet; towards the end of the phenomenon a great number of cirrous clouds were scattered over the sky, and a very light vaporous cloud in the upper region of the atmosphere was slowly moving towards S., gradually increasing its extension.

The following table contains the observations made with the Declinometer throughout the display. Intensity and Inclination showed similar disturbances; but the instruments not being completely in working order, were not registered so minutely.

NOTE.—The minimum value was adopted as Zero, and this remark applies to all the following disturbance observations in any of the three elements.

The last ray, which was of considerable altitude, rose at 5<sup>h</sup>. 30<sup>m</sup>., presenting the form of a very acute pyramid. After this, all that remained was a wide arch of light a few degrees above the horizon, extending within the before-named limits and having a dark belt at its outer boundary. The undulations of this arch gradually died away as the day broke, and totally disappeared when the sun rose above a clear horizon.

267. *May the 8th*, 1858.—On the morning of this day irregularities in the readings of the magnetic instruments made themselves manifest, which assumed a more serious character towards noon, and at 1<sup>h</sup>. 30<sup>m</sup>. p.m. the disturbance observations were commenced.

| 41    | 2·2          | 0·4           | 5·6          |

At Callao severe shocks of an earthquake were felt on the 11th of May (12th of May, Melbourne time).

269. *May the 24th and 25th.*—Great irregularities in the horizontal intensity, at 9<sup>h</sup> a.m., on the 24th, which continued until 5<sup>h</sup> a.m., on the 25th, when this element assumed again a more normal character. At 6<sup>h</sup> 30<sup>m</sup>. p.m., on the 24th, several shocks of an earthquake were felt at Mayence, on the Rhine. (Melbourne mean time 3<sup>h</sup> 41<sup>m</sup>. a.m., on the 25th.)

270. *June the 5th.*—At 1<sup>h</sup> a.m., traces of an Aurora Australis became visible, and at 2<sup>h</sup> 25<sup>m</sup>. the whole horizon, from S. by E. to W., was illuminated by the phenomenon. Cirro Cum. clouds were scattered over the whole southern sky. The brightest part of the phenomenon was at 3<sup>h</sup> 6<sup>m</sup>. in the azimuth of  $\alpha$  Crucis; at 3<sup>h</sup> 17<sup>m</sup>. in that of  $\eta$  Argûs; and at 5<sup>h</sup> 15<sup>m</sup>. in the azimuth of  $\alpha$  Centauri. The Southern Light was distinctly visible towards west at 6<sup>h</sup> 10<sup>m</sup>., notwithstanding the brightness of the Crepuscular arc. There were slight oscillations observed in the magnetic elements, as can be seen from the following tables:—

VALUES OF THE PARTS OF DIVISION { Declination ... 0° 803' (min.)  
Intensity ... 0·000149 (in parts of the intensity)  
Inclination ... 0° 441' n" + 0° 123' n' (min.)

271. *June the 19th.*—Slight disturbances and of short duration in the magnetic elements between 3<sup>h</sup> and 4<sup>h</sup> p.m.

272. *June the 23rd.*—Distinct traces of the Southern Light were seen on the S.W. horizon, at 9<sup>h</sup> p.m.; the greatest luminousness was observed in S. and S.S.E. after 10<sup>h</sup> p.m., but it soon faded away.

Captain Clark, of the *Marco Polo*, does not make mention of the Aurora in his ship's log; he was then in lat. 42° S. and 94° E., and the sky was pretty clear. From 6<sup>h</sup> p.m. the magnetic elements were slightly disturbed.

273. *June the 24th.*—After midnight the above mentioned slight disturbances continued, intensity and inclination being chiefly affected. This lasted throughout the day, and at 7<sup>h</sup> p.m. the horizontal intensity reached its lowest value. The following table shows the principal features of the disturbances on this day:—

VALUES OF THE PARTS OF DIVISION { Declination ... 0° 803' (min.)  
Intensity ... 0·000149 (in parts of the intensity)  
Inclination ... 0° 441' n" + 0° 123' n' (min.)

| 30    | 18·0         | 16·2          | ...          | 7 0   | 19·0         | 0·0           | 0·0          |
| 48    | 20·2         | 21·0          | 7·5          | 8 0   | 14·0         | 7·3           | 8·5          |

At 7<sup>h</sup> 30<sup>m</sup>. p.m., a smart shock of an earthquake was felt on the Terrick Terrick, near the Murray.

274. *June the 25th.*—At 10<sup>h</sup>. a.m., magnets disturbed, chiefly H. intensity. These disturbances lasted until noon, when the magnetic elements returned to a more normal state.

275. *June the 30th.*—At 9<sup>h</sup>. 31<sup>m</sup>. p.m., slight oscillations in the magnetic elements, continuing during the rest of the evening.

276. *July the 3rd.*—Luminousness about the S.W. horizon at 2<sup>h</sup>. a.m., and although the moon was shining very brightly, the silver arc of an Aurora Australis could be seen. It was, however, not higher than 5° or 8°, and shifted constantly between S.S.W. and S.S.E. At 2<sup>h</sup>. 30<sup>m</sup>. the magnets were slightly disturbed.

277. *July the 4th.*—Slight oscillations in the magnets between 10<sup>h</sup>. and 11<sup>h</sup>. p.m.

278. *July the 30th.*—Slight oscillations in the magnets between the hours of 2<sup>h</sup>. p.m. and midnight.

279. *August the 18th.*—After the moon had set there was a bright light perceptible almost due north, equal in intensity to the Zodiacal Light when distinctly visible. There was no veil on that portion of the horizon and it appeared quite free of clouds. Might it have been caused by an Aurora Borealis? The magnetic elements, however, were very quiet.

280. *August the 21st.*—Throughout the day the magnets were subject to more or less serious disturbances; the inclination particularly underwent a most rapid and sudden change at 8<sup>h</sup>. p.m., as will seen by the following table:—

VALUES OF THE PARTS OF DIVISION

|             |     |     |                                      |

| 10       | 5.7          | 1.2           | 10.6         |
| 11       | 8.7          | 3.7           | 12.4         |
| Midnight | 6.3          | 6.7           | 14.6         |

From 8<sup>h</sup>. 35<sup>m</sup>. p.m. on the 21st until 3<sup>h</sup>. 21<sup>m</sup>. a.m. on the 22nd the magnetic instruments were registered every two minutes, but the oscillations in the readings were comparatively small. At 10<sup>h</sup>. 15<sup>m</sup>. p.m. on the 21st an earthquake occurred in Tanunda, South Australia, (10<sup>h</sup>. 45<sup>m</sup>. Melbourne mean time), and according to the *South Australian Register*, shocks of an earthquake were felt on the 21st and 22nd of August in Angaston, South Australia. Throughout the day a furious gale of wind swept the Southern, Indian, and Pacific Oceans, and Torres Straits, as may be seen from the following reports:—

Ship *Ariel*, 163° 20' E., 37° 37' S.—6<sup>h</sup>. 48<sup>m</sup>. a.m. furious gale from W.S.W., barometer fallen to 29.39 inch; and at 10<sup>h</sup>. 48<sup>m</sup>. p.m. (Melbourne mean time), heavy squalls, with lightning and rain.

Ship *Caroline*, 37° 13' S., 150° 49' E.—10<sup>h</sup>. p.m. (Melbourne mean time), heavy gale from W.S.W.

Ship *Johanna Wagner*.—Cape Otway. Heavy gale from W.S.W. at 1<sup>h</sup>. a.m., and at 5<sup>h</sup>. a.m. from N.W. (Melbourne mean time).

Ship *Douglas Castle*, 98° 4' E., 42° 23' S.:—

(Melb. mean time.)

At noon a most furious gale from W.N.W.; barometer 29.18 inch; temperature 41.5

At 3<sup>h</sup>. p.m. „ „ W.N.W.; „ 29.11 „ „ 42.0

At 6<sup>h</sup>. p.m. wind decreasing W.N.W.; „ 29.08 „ „ 41.0

At 9<sup>h</sup>. p.m. „ „ W.N.W.; „ 29.77 „ „ 42.0

At 11<sup>h</sup>. p.m. heavy squalls from S.W., accompanied with hail.

281. *August the 26th.*—Between 2<sup>h</sup>. and 3<sup>h</sup>. p.m. oscillations in the magnets.

282. *August the 28th.*—Between 2<sup>h</sup>. and 3<sup>h</sup>. p.m. magnets disturbed. During a heavy thunderstorm, at midnight, the reading of the horizontal intensity suddenly increased and decreased again.

On the 27th, 11<sup>h</sup>. p.m., declination 45·8; intensity 1·8

On the 28th, midnight, „ 41·4; „ 9·4

„ 1<sup>h</sup>. a.m. „ 47·0; „ 3·0

283. *August the 29th.*—Very slight oscillations in the magnetic elements between 9<sup>h</sup>. 28<sup>m</sup>. and 10<sup>h</sup>. a.m.

284. *August the 30th.*—Slight oscillations in the magnets between 1<sup>h</sup>. and 2<sup>h</sup>. p.m.; and also

285. *August the 31st.*, between 3<sup>h</sup>. and 4<sup>h</sup>. a.m.

286. *September the 1st.*—Slight irregularities in the magnetic readings between noon and 1<sup>h</sup>. 20<sup>m</sup>. p.m.

287. Between 5<sup>h</sup>. and 7<sup>h</sup>. p.m. on *September the 19th* the magnetic elements showed slight disturbances.

288. *September the 20th.*—The magnets greatly disturbed. At 10<sup>h</sup>. p.m. a fine Aurora Australis became visible; notwithstanding the great brightness of the moon (then culminating) the streamers could be distinctly seen. The sky was at times illuminated from S.W. to S.S.E. by the display of the Aurora Australis. At 10<sup>h</sup>. 30<sup>m</sup>. small cumuli clouds spread over the sky, which soon became entirely overcast.

The following table shows the values of the different elements of terrestrial magnetism, as observed at short intervals during the display of the Southern Light.

VALUES OF THE PARTS OF DIVISION { Declination ... .. 0·803' (min.)  
Intensity ... .. 0·000149 (in parts of the intensity)  
Inclination ... .. 0·441' n' + 0·123' n' (min.)

| 20    | 3·1          | 25·7          | 15·3         |       |              |               |              |
| 21    | 4·0          | 24·7          | 15·3         |       |              |               |              |

289. *September the 21st.*—Between 9<sup>h</sup>. and 10<sup>h</sup>. a.m., slight disturbances in the magnets; and at 8 30<sup>m</sup>. p.m., traces of a Southern Light. The brightest part, towards 9<sup>h</sup>., was in S.W. by W., but it moved between W. and S.S.E., and at 9<sup>h</sup>. 45<sup>m</sup>. the greatest brightness was perceptible, in S.S.E., and even a slight tint of pink could be recognised; close to the horizon was a double bank of mist. The magnets continued to be disturbed, although very slightly. This was followed by a most furious gale from the North, during the 22nd of September.

290. On the evening of the 24<sup>th</sup> and the morning of the 25<sup>th</sup> of *September*, the magnetic elements showed disturbances similar to such as are caused by an Auroral Light.

291. *October the 7th.*—From 1<sup>h</sup>. 15<sup>m</sup>. to 3<sup>h</sup>. 30<sup>m</sup>. a.m., an Aurora Australis was seen moving from S.W. by S. towards S.S.E., and even as far as E. The pink streamers were predominating in the south-eastern portion of the sky. The magnetic elements showed considerable disturbances during the night, as well as between 10<sup>h</sup>. a.m. and noon, at which time the south-eastern horizon showed a remarkable brightness in the form of an arc, resembling the silver arc of an Aurora Australis.

292. *October the 28th.*—Considerable disturbances were registered on the morning, between 10<sup>h</sup>. and noon, and throughout the whole day the intensity was rather low.

293. *November the 14th.*—Between midnight and 3<sup>h</sup>. a.m., the magnetic elements were disturbed, the horizontal intensity being chiefly affected.

At 1<sup>h</sup>. 45<sup>m</sup>. a.m. on the 15<sup>th</sup> of November, 1858, shocks of an earthquake were reported to have been felt at Krems, in Austria, (10<sup>h</sup>. 29<sup>m</sup>. a.m. Melbourne mean time).

On the 26<sup>th</sup> of November, 1858, two severe shocks of an earthquake were felt in San Francisco, at 12<sup>h</sup>. 34<sup>m</sup>. a.m., (6<sup>h</sup>. 24<sup>m</sup>. p.m. Melbourne mean time).

294. *December the 5th, 1858.*—Early in the morning, between 2<sup>h</sup>. and 4<sup>h</sup>., an Aurora Australis was observed in Geelong, Sandhurst, and Port Albert. Captain Meyer, of the ship *Cesar and Helene*, being then in lon. 159° E., and lat. 48° 13' S., reports this phenomenon as having been exceedingly bright. Professor Heiss, of Munster, had the kindness to communicate to me the fact, that an unusually fine Aurora Borealis had been observed, between 9<sup>h</sup>. and 12<sup>h</sup>. p.m., on the 4<sup>th</sup> of December, (6<sup>h</sup>. to 9<sup>h</sup>. a.m. on the 5<sup>th</sup>, Melbourne mean time). The magnetic elements were disturbed throughout the morning, and continued to be so for the remainder of the day; but the nature of the disturbances appeared to indicate a periodical alteration in the values of the elements of terrestrial magnetism rather than sudden changes.

295. *December the 23rd, 1858.*—At 9<sup>h</sup>. 38<sup>m</sup>. p.m., before the rise of the moon, distinct traces of an Aurora Australis were seen in S.W. by S., oscillating towards E. and back again to S.W. by S. The magnetic elements disturbed between 10<sup>h</sup>. 5<sup>m</sup>. and 11<sup>h</sup>. p.m.

296. *December the 25th, 1858.*—An Aurora Australis visible between 1<sup>h</sup>. and 3<sup>h</sup>. a.m.; the brightness of the sky extended from S. by E. to S.W., and at 1<sup>h</sup>. 22<sup>m</sup>. a fine broad streamer rose from the south to an altitude of 20° and 25°; this streamer soon afterwards appeared divided into two streamers, which after two or three minutes totally disappeared; shortly after 2<sup>h</sup>. a.m. the phenomenon rapidly declined; the magnetic elements showed considerable and rapid changes, as will be seen from the following table:—

VALUES OF THE PARTS OF DIVISION { Declination ... 0.803' (min.)  
Intensity ... 0.000149 (in parts of the intensity)  
Inclination ... 0.441' n" + 0.123' n' (min.)

297. *January the 16th, 1859.*—Soon after midnight the magnetic elements showed considerable disturbances, which increased towards 2<sup>h</sup>. a.m.; at 2<sup>h</sup>. 35<sup>m</sup>. the needle of the inclination made a tremulous motion in a vertical sense, and by 4<sup>h</sup>. a.m., the magnets returned to a more normal state, with the exception of the horizontal intensity, which continued to be comparatively low; as the sky was overcast, nothing of an Aurora Australis could be observed, nor is any mention made of the phenomenon in the logs of Captain Tregarthon, of the *Mandarin*, and Captain Bichard, of the *Leopold*, who were respectively in lat. 40° S. and 122° E., and 41° S. and 139° E., with a strong breeze from W.S.W. and W. by N.

298. *February the 16th, 1859.*—Slight oscillations in the readings of the different magnetic instruments between 3<sup>h</sup>. and 4<sup>h</sup>. a.m.

299. *February the 17th and 18th, 1859.*—Oscillations of the magnets during the evenings, between 10<sup>h</sup>. and 11<sup>h</sup>. p.m., and a considerable brightness was visible towards north.

300. *February the 23rd, 1859.*—Great magnetic storm commencing at 6<sup>h</sup>. a.m., and lasting until 6<sup>h</sup>. p.m. with more or less vehemency.

The following table contains the principal features of the disturbances:—

|                                 |             |     |     |                                      |

301. *February the 24th, 1859.*—The magnets, after having returned to a more normal reading, again commenced to be disturbed at 5<sup>h</sup>. a.m., and continued so almost throughout the day. The greatest oscillations took place between 5<sup>h</sup>. and 7<sup>h</sup>. a.m., and from 10<sup>h</sup>. to 11<sup>h</sup>. p.m.

The following table contains the disturbances as registered on this day:—

|                                 |             |     |     |                                      |

According to information received from Professor Heiss, of Munster, an Aurora Borealis was seen in Europe between the hours of 7<sup>h</sup>. and 12<sup>h</sup>. p.m. on the 23<sup>rd</sup>—(4<sup>h</sup>. and 9<sup>h</sup>. a.m. on the 24<sup>th</sup>, Melbourne mean time).

302. *February the 25th, 1859.*—The disturbances in the magnetic elements continued through the morning of this day, and assumed their greatest values between 3<sup>h</sup>. and 4<sup>h</sup>. a.m.

303. *February the 27th, 1859.*—Soon after midnight, a splendid Aurora Australis became visible, the most prominent features of which are given below:—

At 12<sup>h</sup>. 25<sup>m</sup>., five or six streamers were seen extending on the horizon from S. to S.S.W.; they were all long, narrow rays, rose to an altitude of about 18°, and were of a pale grey color, but sharply defined; they soon disappeared, and were replaced, at 12<sup>h</sup>. 30<sup>m</sup>., by some of a broader but less defined character, which extended to S. by E.

12<sup>h</sup>. 40<sup>m</sup>.—Scintillations were only barely visible; a luminous veil or vaporous appearance lying on the horizon, between S. by E. and S.W. by S.

12<sup>h</sup>. 45<sup>m</sup>.—Two streamers to S. by E. and S., with a tinge of red; a smaller streamer to S.W. by S.

1<sup>h</sup>. 7<sup>m</sup>.—A low, level bank of dark cloud lying directly on the horizon; the sky above it exceedingly luminous.

1<sup>h</sup>. 9<sup>m</sup>.—Scintillations again visible; one streamer tinged red.

1<sup>h</sup>. 15<sup>m</sup>.—No streamers visible.

1<sup>h</sup>. 21<sup>m</sup>.—No streamers; luminous mass abruptly terminating over the Williamstown light. A few cirro-cum. clouds above the luminous mass to S.

1<sup>h</sup>. 26<sup>m</sup>.—Luminous arch very beautiful; streamers again visible, broad and short but very distinct, of a pale yellow and greenish yellow color, very bright close to the level bank of cloud on horizon.

1<sup>h</sup>. 33<sup>m</sup>.—Four very fine rays, short and not pointed, one extending as far as S.W., and one to S. by E., or even further.

- 1<sup>h</sup>. 38<sup>m</sup>.—Splendid long, narrow, pointed rays, very bright and sharply defined; the colors red and yellow, both distinctly developed. One ray, in S.S.W., made (approximately) an angle of 89° with the horizon. To the S.S.E., a beautiful long red streamer; and in S. by W., and also more or less in S., rays like bundles of light, which did not descend to the luminous arc below; one ray, in S., rose as high as the smaller Magellan cloud. These streamers faded very rapidly, but were replaced, at—
- 1<sup>h</sup>. 44<sup>m</sup>. by others of exactly similar character.
- 1<sup>h</sup>. 47<sup>m</sup>.—All streamers disappeared, except one in S. by E.
- 1<sup>h</sup>. 51<sup>m</sup>.—Most beautiful streamers again, very broad; one extending to S.E. by S., making an approximate angle of 60° with the horizon; one, in S., intensely red.
- 2<sup>h</sup>. 5<sup>m</sup>.—Two streamers in S.S.E.; broad and dull, angle 84°.
- 2<sup>h</sup>. 9<sup>m</sup>.—No streamers visible.
- 2<sup>h</sup>. 15<sup>m</sup>.—The Auroral Light reached at this time its greatest brilliancy. The whole sky from S.S.E. to S.W. covered with the most brilliant rays, all of which appeared with the greatest rapidity; to the westward, a very fine red ray; one streamer, as nearly as could be ascertained, made an angle of 90° with the horizon, and was situated between S. by W. and S.S.W.; some of these streamers must have reached an altitude of 35°.
- 2<sup>h</sup>. 28<sup>m</sup>.—Bright rays of light shooting at times from the horizon, chiefly in S.S.W.
- 2<sup>h</sup>. 30<sup>m</sup>.—A broad pink stripe in S.W. by W., a few degrees above the horizon.
- 2<sup>h</sup>. 34<sup>m</sup>.—The greatest luminousness was in the azimuth of Nebula Major, a few degrees below it; the rays slightly inclined towards W.
- 2<sup>h</sup>. 39<sup>m</sup>.—A sharply defined ray, almost perpendicular, in S. by W.
- 2<sup>h</sup>. 41<sup>m</sup>.—Only diffused light, all over the sky from W.S.W. to S.S.E.
- 2<sup>h</sup>. 44<sup>m</sup>.—Electric tension 2·35, positive.
- 2<sup>h</sup>. 45<sup>m</sup>.—Badly defined broad streamers; universal red glow, extending as far as S. and S. by E.
- 2<sup>h</sup>. 50<sup>m</sup>.—Diffused reddish luminousness.
- 2<sup>h</sup>. 55<sup>m</sup>.—Luminous appearance very much duller.
- 3<sup>h</sup>. 8<sup>m</sup>.—One streak visible.
- 3<sup>h</sup>. 16<sup>m</sup>.—One feeble streak, about S.
- 3<sup>h</sup>. 30<sup>m</sup>.—Red ray in S.W. by S.; luminousness somewhat brighter; rather dark veil, or cirro-strat. clouds, hanging over S.S.W., in the form of an inverted arch.
- 4<sup>h</sup>.—Luminousness almost totally disappeared. The disturbance observations during this display of the Aurora are given in the following table:—

|                                 |             |     |     |                                      |

I received information from Professor Heiss, of Munster, that an Aurora Borealis and great magnetic disturbances had been observed in Europe during the evening of the 26th (morning of the 27th, Melbourne mean time).

## VII. SOLAR SPOTS.

---

304. The registration of solar spots was not carried on systematically during the year 1858-59, as no arrangement could be made to insure the uninterrupted progress of investigations of this nature; the more so as with the limited means at the disposal of the Observatory more urgent questions had to be taken into consideration, with a view of contributing towards their final solution.

305. The instrument used in drawing the solar spots was manufactured at the optical workshop of Ch. Steinheil, of Munich, and the magnifying power applied is 79', the aperture of the glass being three inches. The spots were divided into groups, and the single ones are described with "very fine spots," "fine spots," "spots," "small spots," "specks," "small specks;" proceeding from the largest size observed to a speck scarcely discernible with the telescope above described.

306. Drawings of the sun have been made on the following days, including also some observations made in 1857:—

*February the 21st, 1857.*—One group of spots only.

*September the 17th, 1857.*—One group of spots observed during the eclipse of the sun.

*October the 15th, 1857.*—Two groups of spots 4<sup>h</sup> 15<sup>m</sup>. p.m.:—I. Pretty large spot and several specks.

II. Several very small specks.

*October the 21st, 1857.*—One small spot only.

*October the 23rd, 1857.*—One small spot and several little specks.

*October the 27th, 1857.*—Only a few very small specks.

*November the 7th, 1857.*—Two groups of spots:—I. Two spots. II. One spot.

*November the 26th, 1857.*—One fine spot.

*December the 18th, 1857.*—Three groups of spots:—I. Three small spots. II. Several small specks.

III. One fine spot.

*March the 2nd, 1858.*—Five groups of spots:—I. A single spot. II. A single spot. III. Seven little specks. IV. One fine spot. V. One spot, and four little specks.

*March the 13th, 1858.*—Two groups of spots:—I. One single spot. II. Several little specks.

*March the 18th, 1858.*—Three groups of solar spots:—I. A very extensive and fine spot. II. One spot and several specks. III. One spot and a little speck.

*May the 9th, 1858.*—One group of spots, consisting of one single spot and three specks.

*May the 17th, 1858.*—One group, consisting of a single spot.

*May the 25th, 1858.*—Four groups of solar spots:—I. A fine spot, surrounded by five or six little specks.

II. Three little specks in a straight line, parallel to the equator of the sun. III. Four small specks.

IV. One single little speck.

*June the 4th, 1858.*—Three groups:—I. One fine spot, with several little specks. II. Two small spots.

III. A cluster of little specks.

*June the 8th, 1858.*—Four groups of solar spots and faculæ:—I. A fine solar spot, surrounded by four little specks and some bright points. II. Faculæ. III. Two small spots, surrounded by faculæ. IV. A few faculæ.

*June the 14th, 1858.*—One fine spot only.

*June the 23rd, 1858.*—Two groups of solar spots:—I. One small spot. II. Three specks.

*June the 24th, 1858.*—Four groups:—I. One small spot. II. Four specks.

*June the 28th, 1858.*—Two groups of solar spots, at 9<sup>h</sup> 15<sup>m</sup>. a.m. I. One small spot and several little specks. II. Three small spots and a great number of little specks.

*June the 29th, 1858.*—Five groups at 4<sup>h</sup> 5<sup>m</sup>. p.m.:—I. Six small spots and specks. II. One little speck and a cluster of faculæ. III. Three small spots and faculæ. IV. One spot and a small speck. V. One small spot and three specks. I., III., IV., and V. were nearly connected with each other by very small specks, and the whole system of groups extended in the direction of the sun's equator, or parallel therewith.

- July the 2nd, 1858.*—Seven groups of solar spots at 4<sup>h</sup>. 5<sup>m</sup>. p.m.:—I. One spot with a small speck and faculæ. II. Two spots united by a halo. III. One spot and several specks. IV. Two small spots. V. One small spot. VI. Two small spots. VII. Two small spots united by a halo, and close by faculæ. The whole range of these different spots extended in the direction of the sun's equator.
- August the 4th, 1858.*, at 9<sup>h</sup>. a.m.—One fine solar spot.
- August the 20th, 1858.*—Three groups:—I. Two spots joined by several specks. II. Several little specks. III. Two spots joined by several little specks.

307. During the year 1859–60 these investigations were carried on systematically, and drawings of the sun have been made for nearly seventy different days. To do still more justice to a matter of such importance arrangements are being made to take photographic sketches of the sun's surface and measure the single spots with the help of a position and ring micrometer attached to the telescope above referred to.
